(54) Title: METHOD FOR PROVIDING IMS-BASED WIRELESS DOWNLOAD SERVICES

(57) Abstract: Various embodiments are described to provide wireless download services that are more robust than those currently available. Signaling between and among the user equipment (UE) (101) obtaining download service, one or more IMS (IP multimedia subsystem) servers (151), and the download server (161) from which the content is obtained enable an improved level of service. Some improvements that may be realized include guaranteed QoS levels for content downloads, user selection of QoS (in real-time and per content request, possibly), flexible pricing options (e.g., per session, contentbased, QoS-based billing), and authentication on a per-content basis.
