PYRROLOBENZODIAZEPINES AND CONJUGATES THEREOF

The present invention relates to pyrrolobenzodiazepines (PBDs), in particular pyrrolobenzodiazepines having a linker group connected to a cell binding agent.

5

Background to the invention

Pyrrolobenzodiazepines

Some pyrrolobenzodiazepines (PBDs) have the ability to recognise and bond to specific sequences of DNA; the preferred sequence is PuGpu. The first PBD antitumour antibiotic, anthramycin, was discovered in 1965 (Leimgruber, *et al.*, *J. Am. Chem. Soc.*, **87**, 5793-5795 (1965); Leimgruber, *et al.*, *J. Am. Chem. Soc.*, **87**, 5791-5793 (1965)). Since then, a number of naturally occurring PBDs have been reported, and over 10 synthetic routes have been developed to a variety of analogues (Thurston, *et al.*, *Chem. Rev.* **1994**, 433-465 (1994); Antonow, D. and Thurston, D.E., *Chem. Rev.* **2011** 111 (4), 2815-2864). Family members include abbeymycin (Hochlowski, *et al.*, *J. Antibiotics*, **40**, 145-148 (1987)), chicamycin (Konishi, *et al.*, *J. Antibiotics*, **37**, 200-206 (1984)), DC-81 (Japanese Patent 58-180 487; Thurston, *et al.*, *Chem. Brit.*, **26**, 767-772 (1990); Bose, *et al.*, *Tetrahedron*, **48**, 751-758 (1992)), mazethramycin (Kuminoto, *et al.*, *J. Antibiotics*, **33**, 665-667 (1980)), neothramycins A and B (Takeuchi, *et al.*, *J. Antibiotics*, **29**, 93-96 (1976)), porothramycin (Tsunakawa, *et al.*, *J. Antibiotics*, **41**, 1366-1373 (1988)), prothracarcin (Shimizu, *et al.*, *J. Antibiotics*, **29**, 2492-2503 (1982); Langley and Thurston, *J. Org. Chem.*, **52**, 91-97 (1987)), sibanomicin (DC-102)(Hara, *et al.*, *J. Antibiotics*, **41**, 702-704 (1988); Itoh, *et al.*, *J. Antibiotics*, **41**, 1281-1284 (1988)), sibiromycin (Leber, *et al.*, *J. Am. Chem. Soc.*, **110**, 2992-2993 (1988)) and tomamycin (Arima, *et al.*, *J. Antibiotics*, **25**, 437-444 (1972)). PBDs are of the general structure:

25

They differ in the number, type and position of substituents, in both their aromatic A rings and pyrrolo C rings, and in the degree of saturation of the C ring. In the B-ring there is either an imine (N=C), a carbinolamine (NH-CH(OH)), or a carbinolamine methyl ether (NH-CH(OMe)) at the N10-C11 position which is the electrophilic centre responsible for alkylating

30

DNA. All of the known natural products have an (*S*)-configuration at the chiral C11a position which provides them with a right-handed twist when viewed from the C ring towards the A ring. This gives them the appropriate three-dimensional shape for isohelicity with the minor groove of B-form DNA, leading to a snug fit at the binding site (Kohn, In *Antibiotics III*. Springer-Verlag, New York, pp. 3-11 (1975); Hurley and Needham-VanDevanter, *Acc. Chem. Res.*, **19**, 230-237 (1986)). Their ability to form an adduct in the minor groove, enables them to interfere with DNA processing, hence their use as antitumour agents.

A particularly advantageous pyrrolobenzodiazepine compound is described by Gregson *et al.* (*Chem. Commun.* **1999**, 797-798) as compound **1**, and by Gregson *et al.* (*J. Med. Chem.* **2001**, *44*, 1161-1174) as compound **4a**. This compound, also known as SJG-136, is shown below:

Other dimeric PBD compounds, such as those bearing C2 aryl substituents in WO 2005/085251, have been disclosed, an example being:

These compounds have been shown to be highly useful cytotoxic agents.

Antibody-drug conjugates

Antibody therapy has been established for the targeted treatment of patients with cancer, immunological and angiogenic disorders (Carter, P. (2006) *Nature Reviews Immunology* 6:343-357). The use of antibody-drug conjugates (ADC), i.e. immunoconjugates, for the local delivery of cytotoxic or cytostatic agents, i.e. drugs to kill or inhibit tumor cells in the treatment of cancer, targets delivery of the drug moiety to tumors, and intracellular accumulation therein, whereas systemic administration of these unconjugated drug agents may result in unacceptable levels of toxicity to normal cells as well as the tumor cells sought to be eliminated (Xie *et al* (2006) *Expert. Opin. Biol. Ther.* 6(3):281-291; Kovtun *et al* (2006)

Cancer Res. 66(6):3214-3121; Law *et al* (2006) *Cancer Res.* 66(4):2328-2337; Wu *et al* (2005) *Nature Biotech.* 23(9):1137-1145; Lambert J. (2005) *Current Opin. in Pharmacol.* 5:543-549; Hamann P. (2005) *Expert Opin. Ther. Patents* 15(9):1087-1103; Payne, G. (2003) *Cancer Cell* 3:207-212; Trail *et al* (2003) *Cancer Immunol. Immunother.* 52:328-337; Syrigos and Epenetos (1999) *Anticancer Research* 19:605-614).

Maximal efficacy with minimal toxicity is sought thereby. Efforts to design and refine ADC have focused on the selectivity of monoclonal antibodies (mAbs) as well as drug mechanism of action, drug-linking, drug/antibody ratio (loading), and drug-releasing properties (Junutula, *et al.*, 2008b *Nature Biotech.*, 26(8):925-932; Dornan *et al* (2009) *Blood* 114(13):2721-2729; US 7521541; US 7723485; WO2009/052249; McDonagh (2006) *Protein Eng. Design & Sel.* 19(7): 299-307; Doronina *et al* (2006) *Bioconj. Chem.* 17:114-124; Erickson *et al* (2006) *Cancer Res.* 66(8):1-8; Sanderson *et al* (2005) *Clin. Cancer Res.* 11:843-852; Jeffrey *et al* (2005) *J. Med. Chem.* 48:1344-1358; Hamblett *et al* (2004) *Clin. Cancer Res.* 10:7063-7070). Drug moieties may impart their cytotoxic and cytostatic effects by mechanisms including tubulin binding, DNA binding, or topoisomerase inhibition. Some cytotoxic drugs tend to be inactive or less active when conjugated to large antibodies or protein receptor ligands.

PBDs in ADCs

Dimeric PBDs have been disclosed as the drugs in drug conjugates. For example, in WO 2011/130598, dimer PBD compounds having linker groups for connection to a cell binding agent, such as an antibody, are disclosed where the linker group is attached to one of the available N10 positions, and are generally cleaved by action of an enzyme on the linker group.

By contrast, in WO 2011/130613 and WO 2011/130616, dimer PBD compounds having linker groups for connection to a cell binding agent, such as an antibody, are disclosed where the linker group is attached via an aromatic group at one of the C2 positions, and are generally cleaved by action of an enzyme on the linker group. Such antibody drug conjugates are also described in Flygare, J., *et al*, *Chem. Biol. Drug Des.* 81: 113-121 (2013), which also describes other types of antibody drug conjugates.

A further approach is described in WO 2007/085930, wherein tomamycin-like dimers have a linker group for connection to a cell binding agent, such as an antibody, where the linker

group is attached to the tether between the tomamycin units, and are generally cleaved by action of an enzyme on the linker group.

The present inventors have developed a novel approach to forming PBD conjugates with cell binding agents, and in particular PBD antibody conjugates.

Summary of the Invention

In a general aspect the present invention provides a conjugate comprising a PBD dimer compound with a linker for connecting to a cell binding agent, wherein the linker has a triazole, piperazine, propargylene or oxime group attached to a phenylene or pyridylene in the bridge linking the two PBD monomers. The cell binding agent is preferably an antibody.

In a first aspect, the present invention provides novel conjugate compounds of formula (A):

wherein:

R^6 and R^9 are independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR' , NO_2 , Me_3Sn and halo;

R^7 is independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR' , NO_2 , Me_3Sn and halo;

Y is selected from formulae A1, A2, A3, A4, A5 and A6:

(A1)

(A2)

(A3)

(A4)

(A5)

(A6)

L is a linker connected to a cell binding agent;

CBA is the cell binding agent;

n is an integer selected in the range of 0 to 48;

R^{A4} is a C₁₋₆ alkylene group;

either

(a) R¹⁰ is H, and R¹¹ is OH, OR^A, where R^A is C₁₋₄ alkyl; or

(b) R¹⁰ and R¹¹ form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound; or

(c) R¹⁰ is H and R¹¹ is OSO₂M, where z is 2 or 3 and M is a monovalent pharmaceutically acceptable cation;

R and R' are each independently selected from optionally substituted C₁₋₁₂ alkyl, C₃₋₂₀ heterocyclyl and C₅₋₂₀ aryl groups, and optionally in relation to the group NRR', R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring;

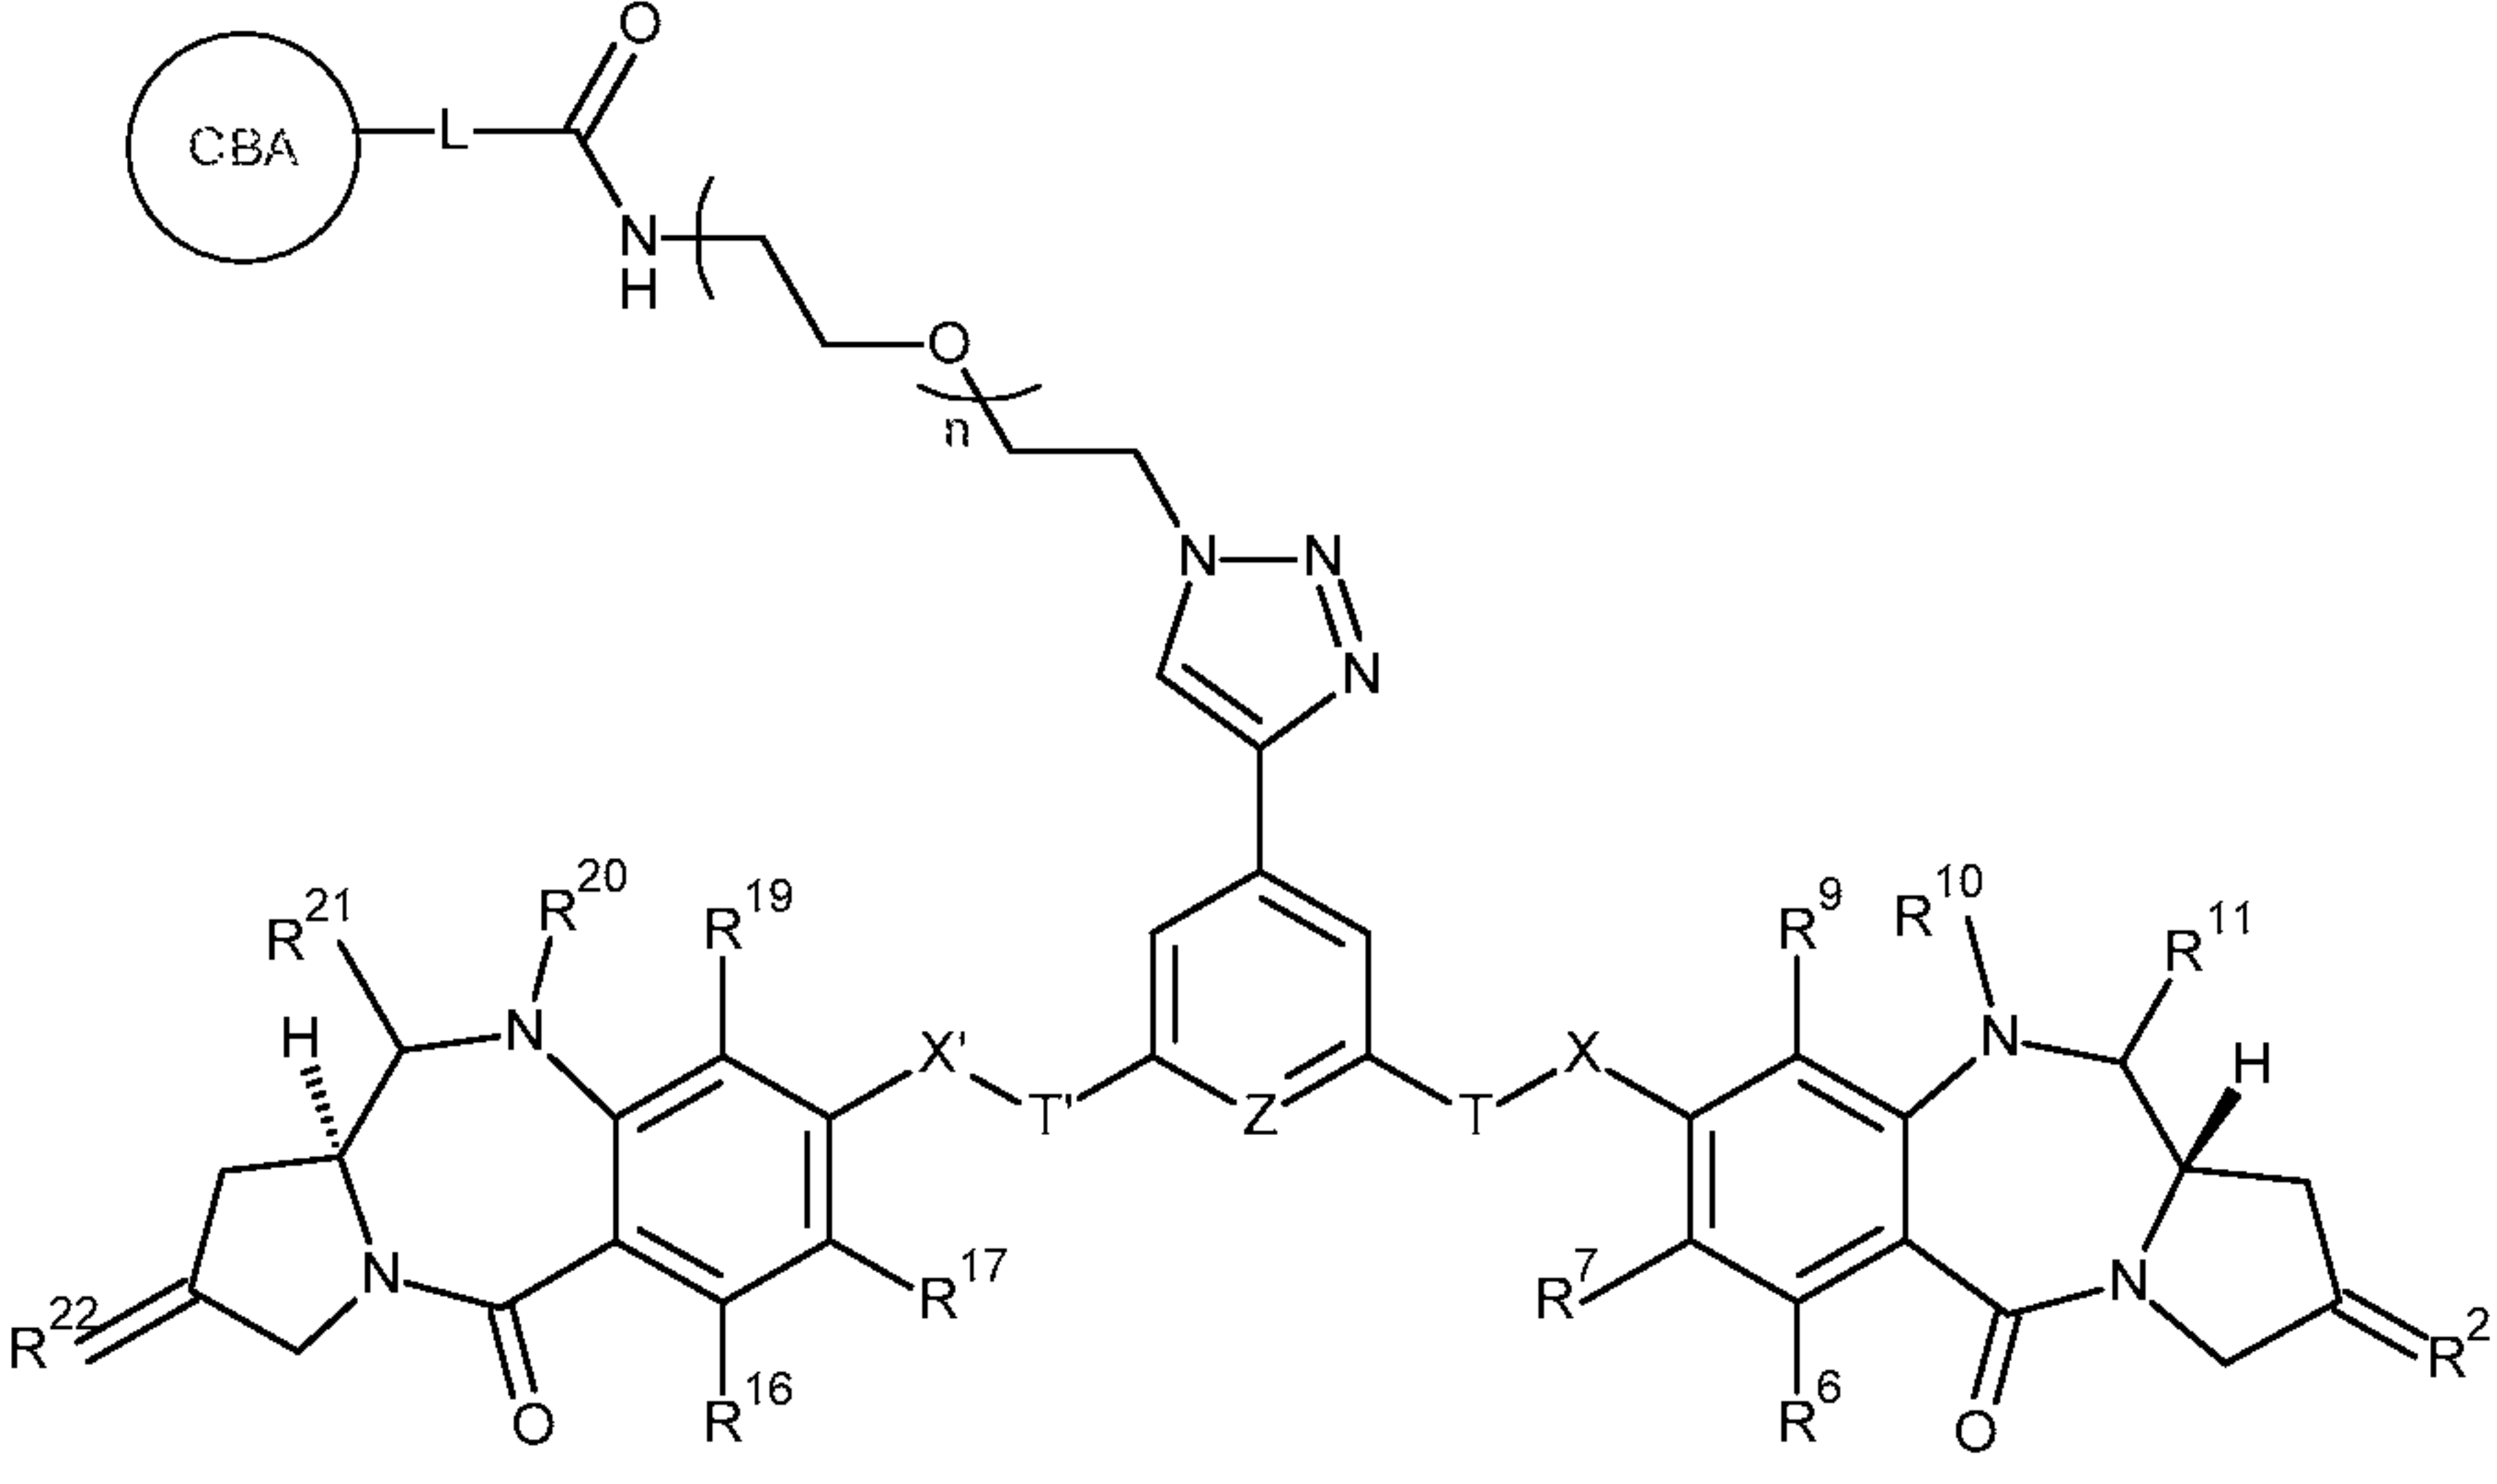

wherein R¹⁶, R¹⁷, R¹⁹, R²⁰, R²¹ and R²² are as defined for R⁶, R⁷, R⁹, R¹⁰, R¹¹ and R² respectively;

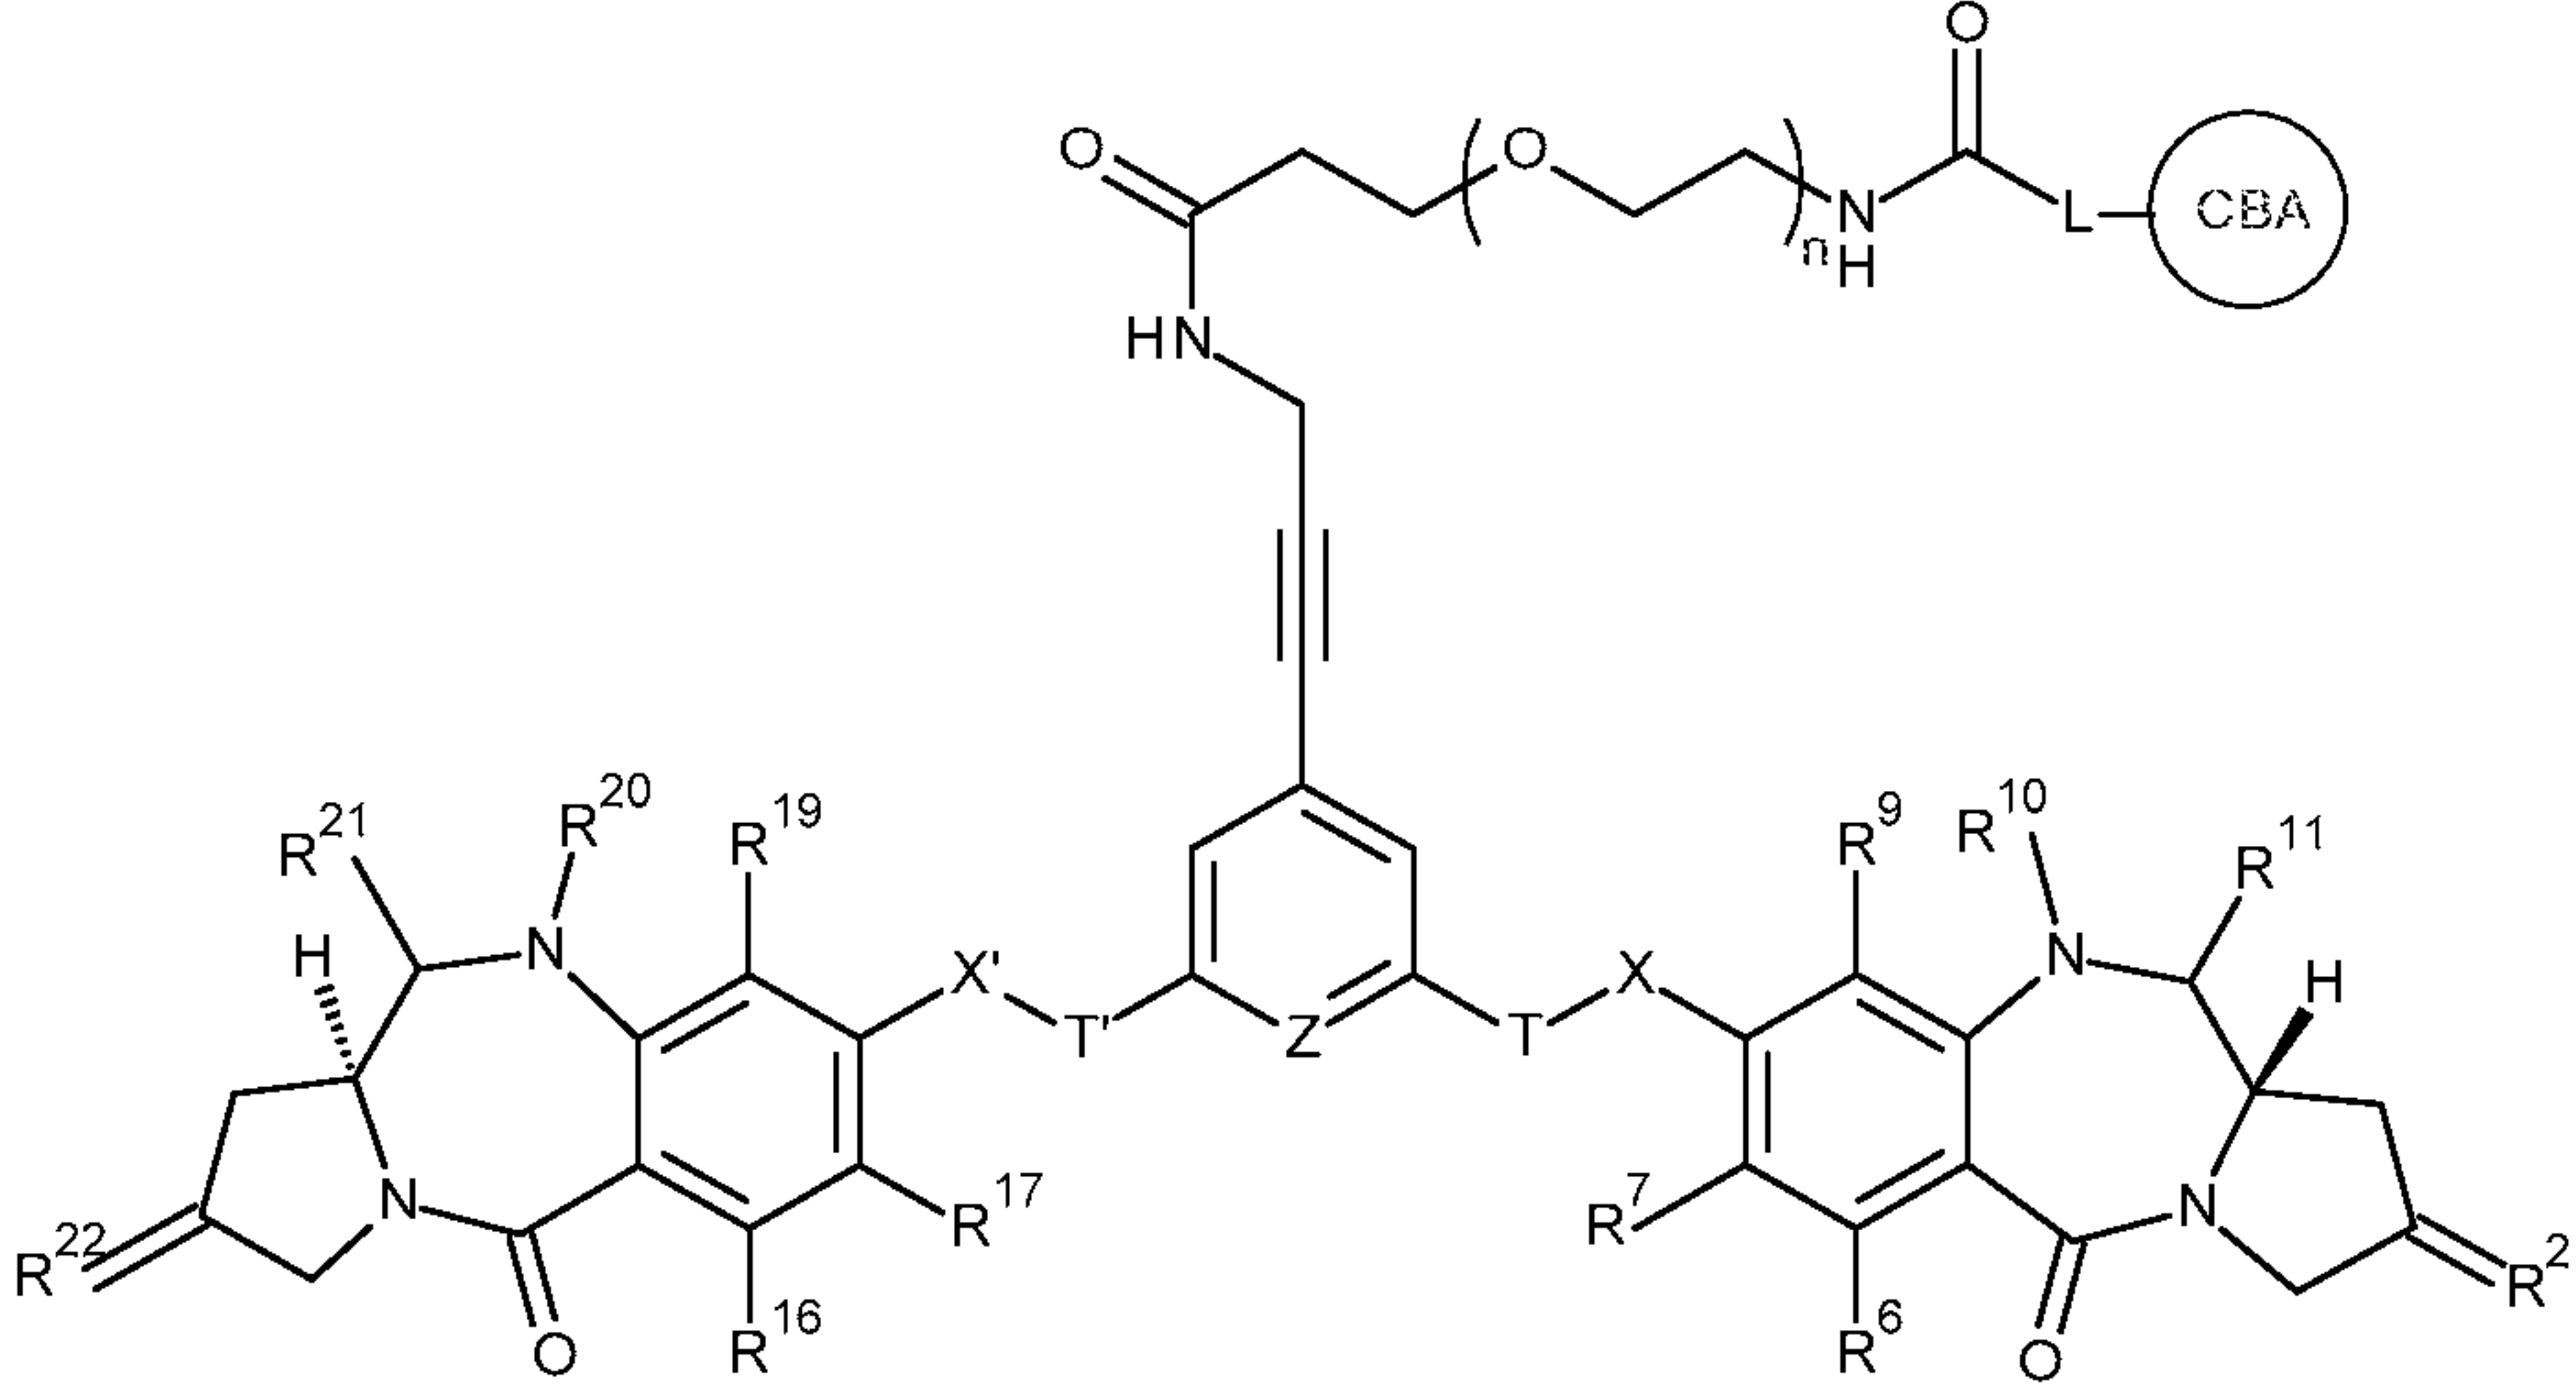

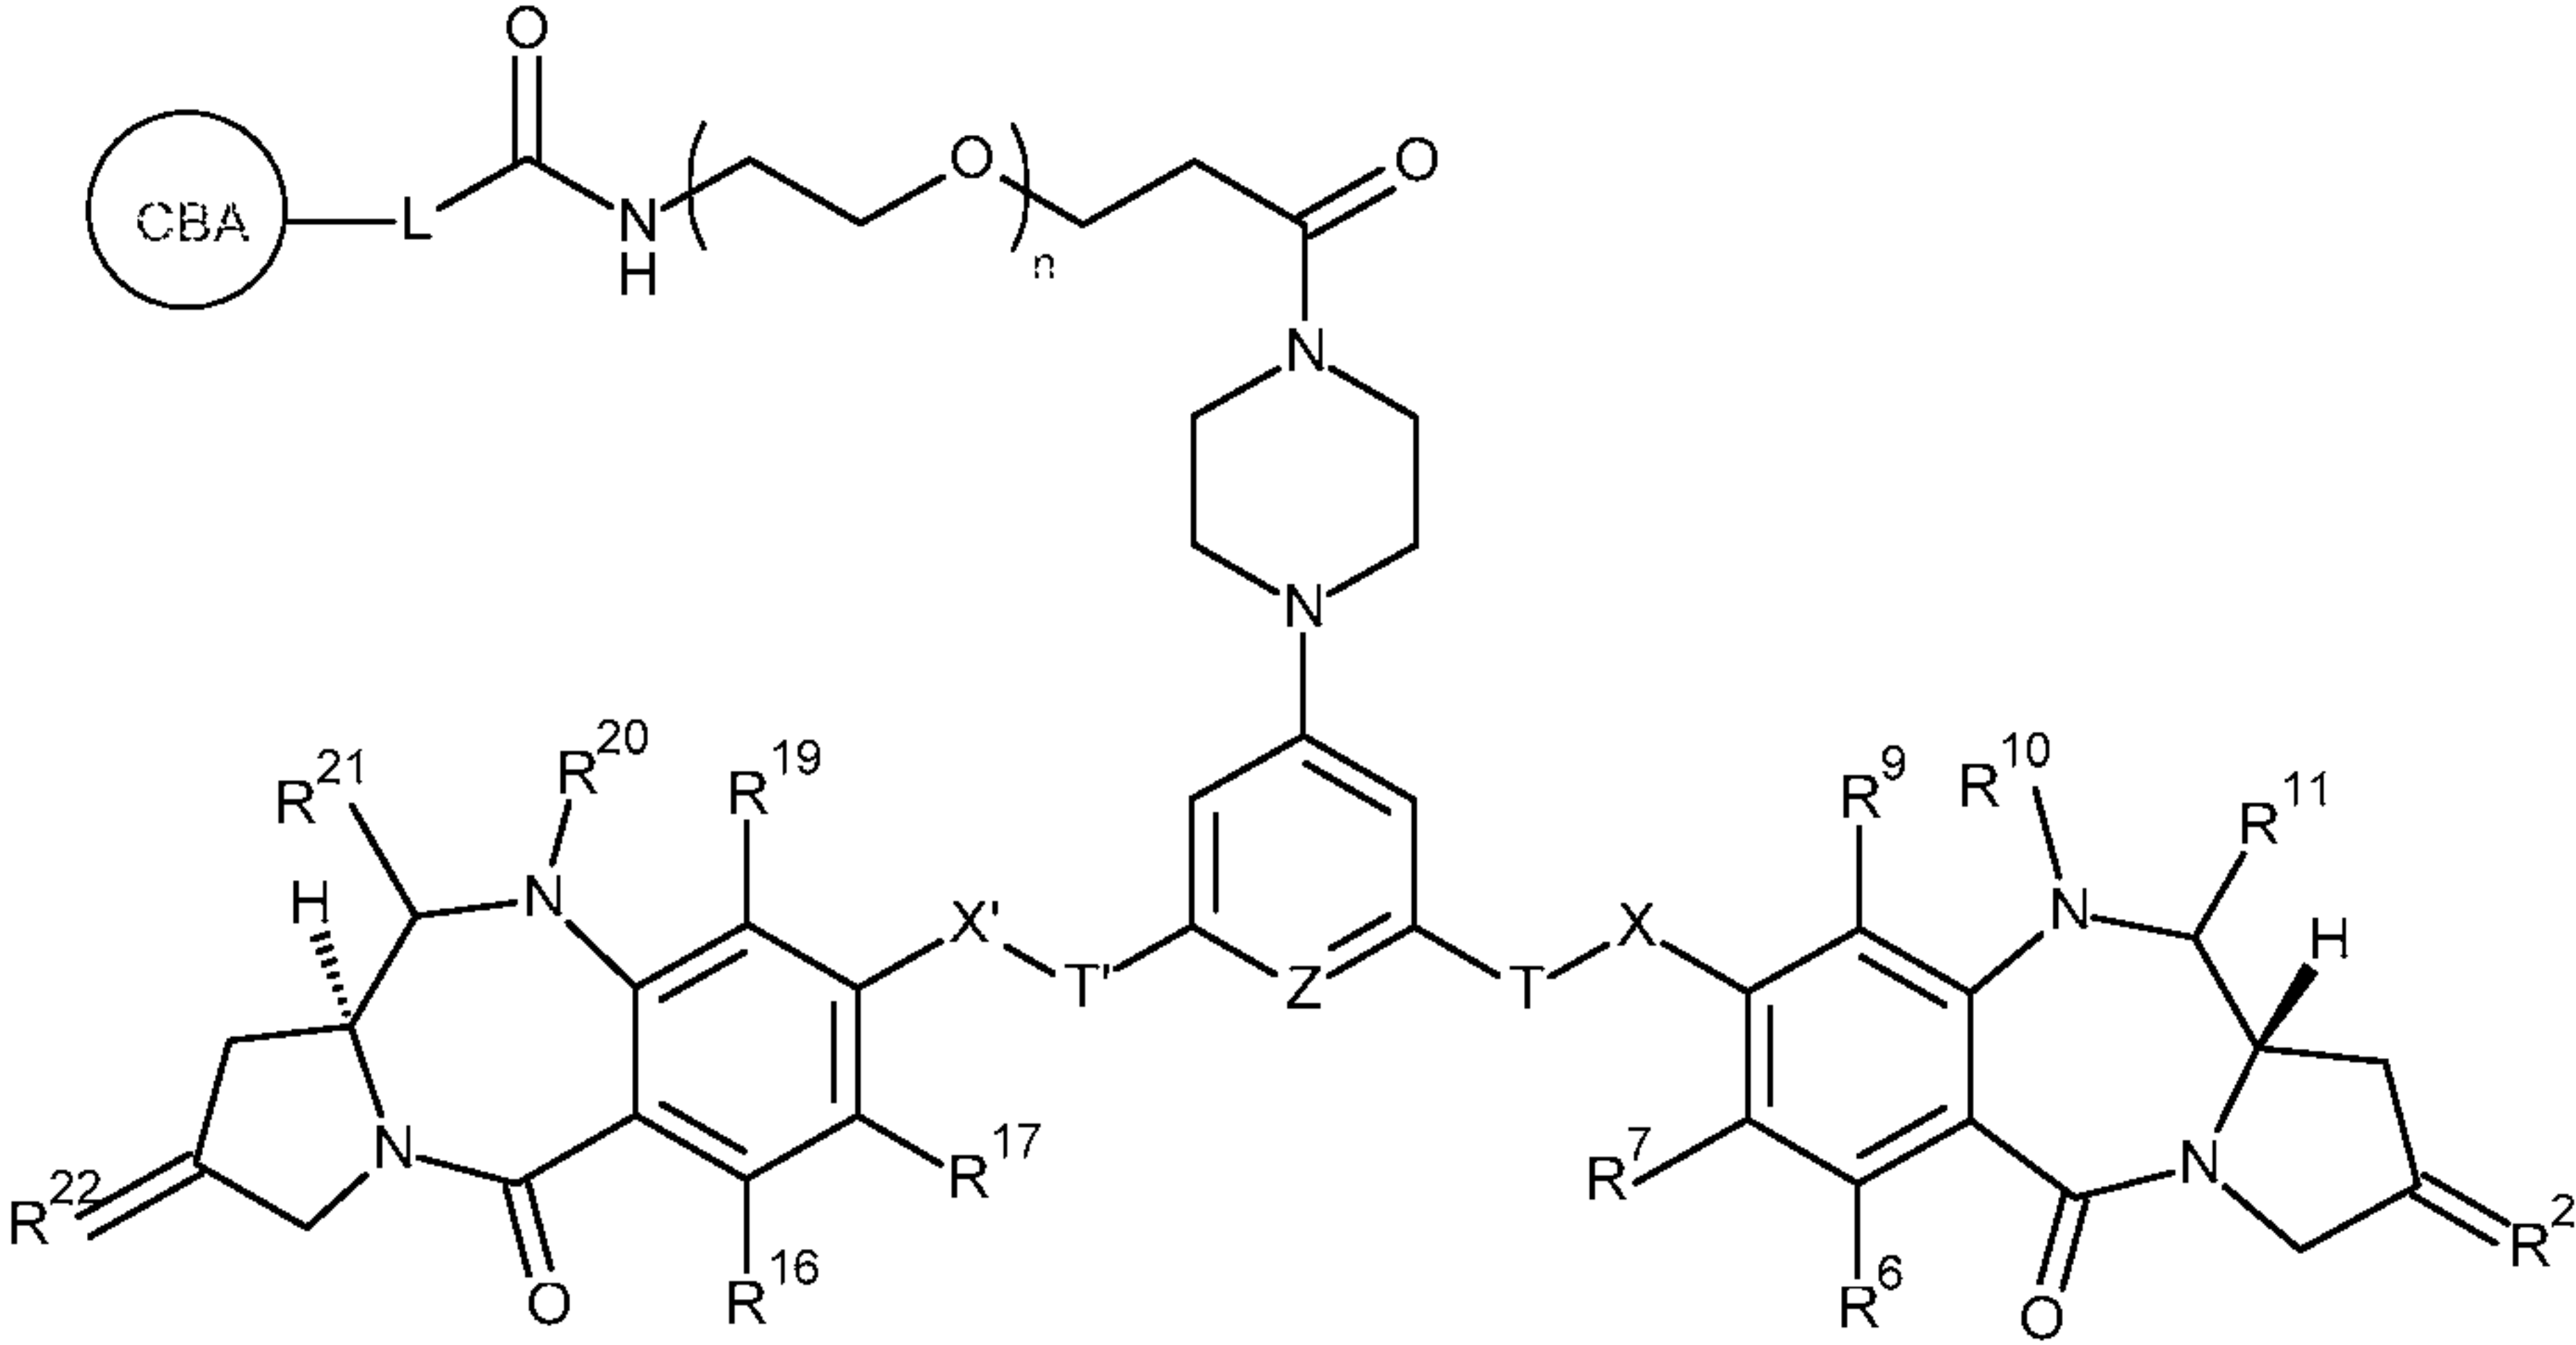

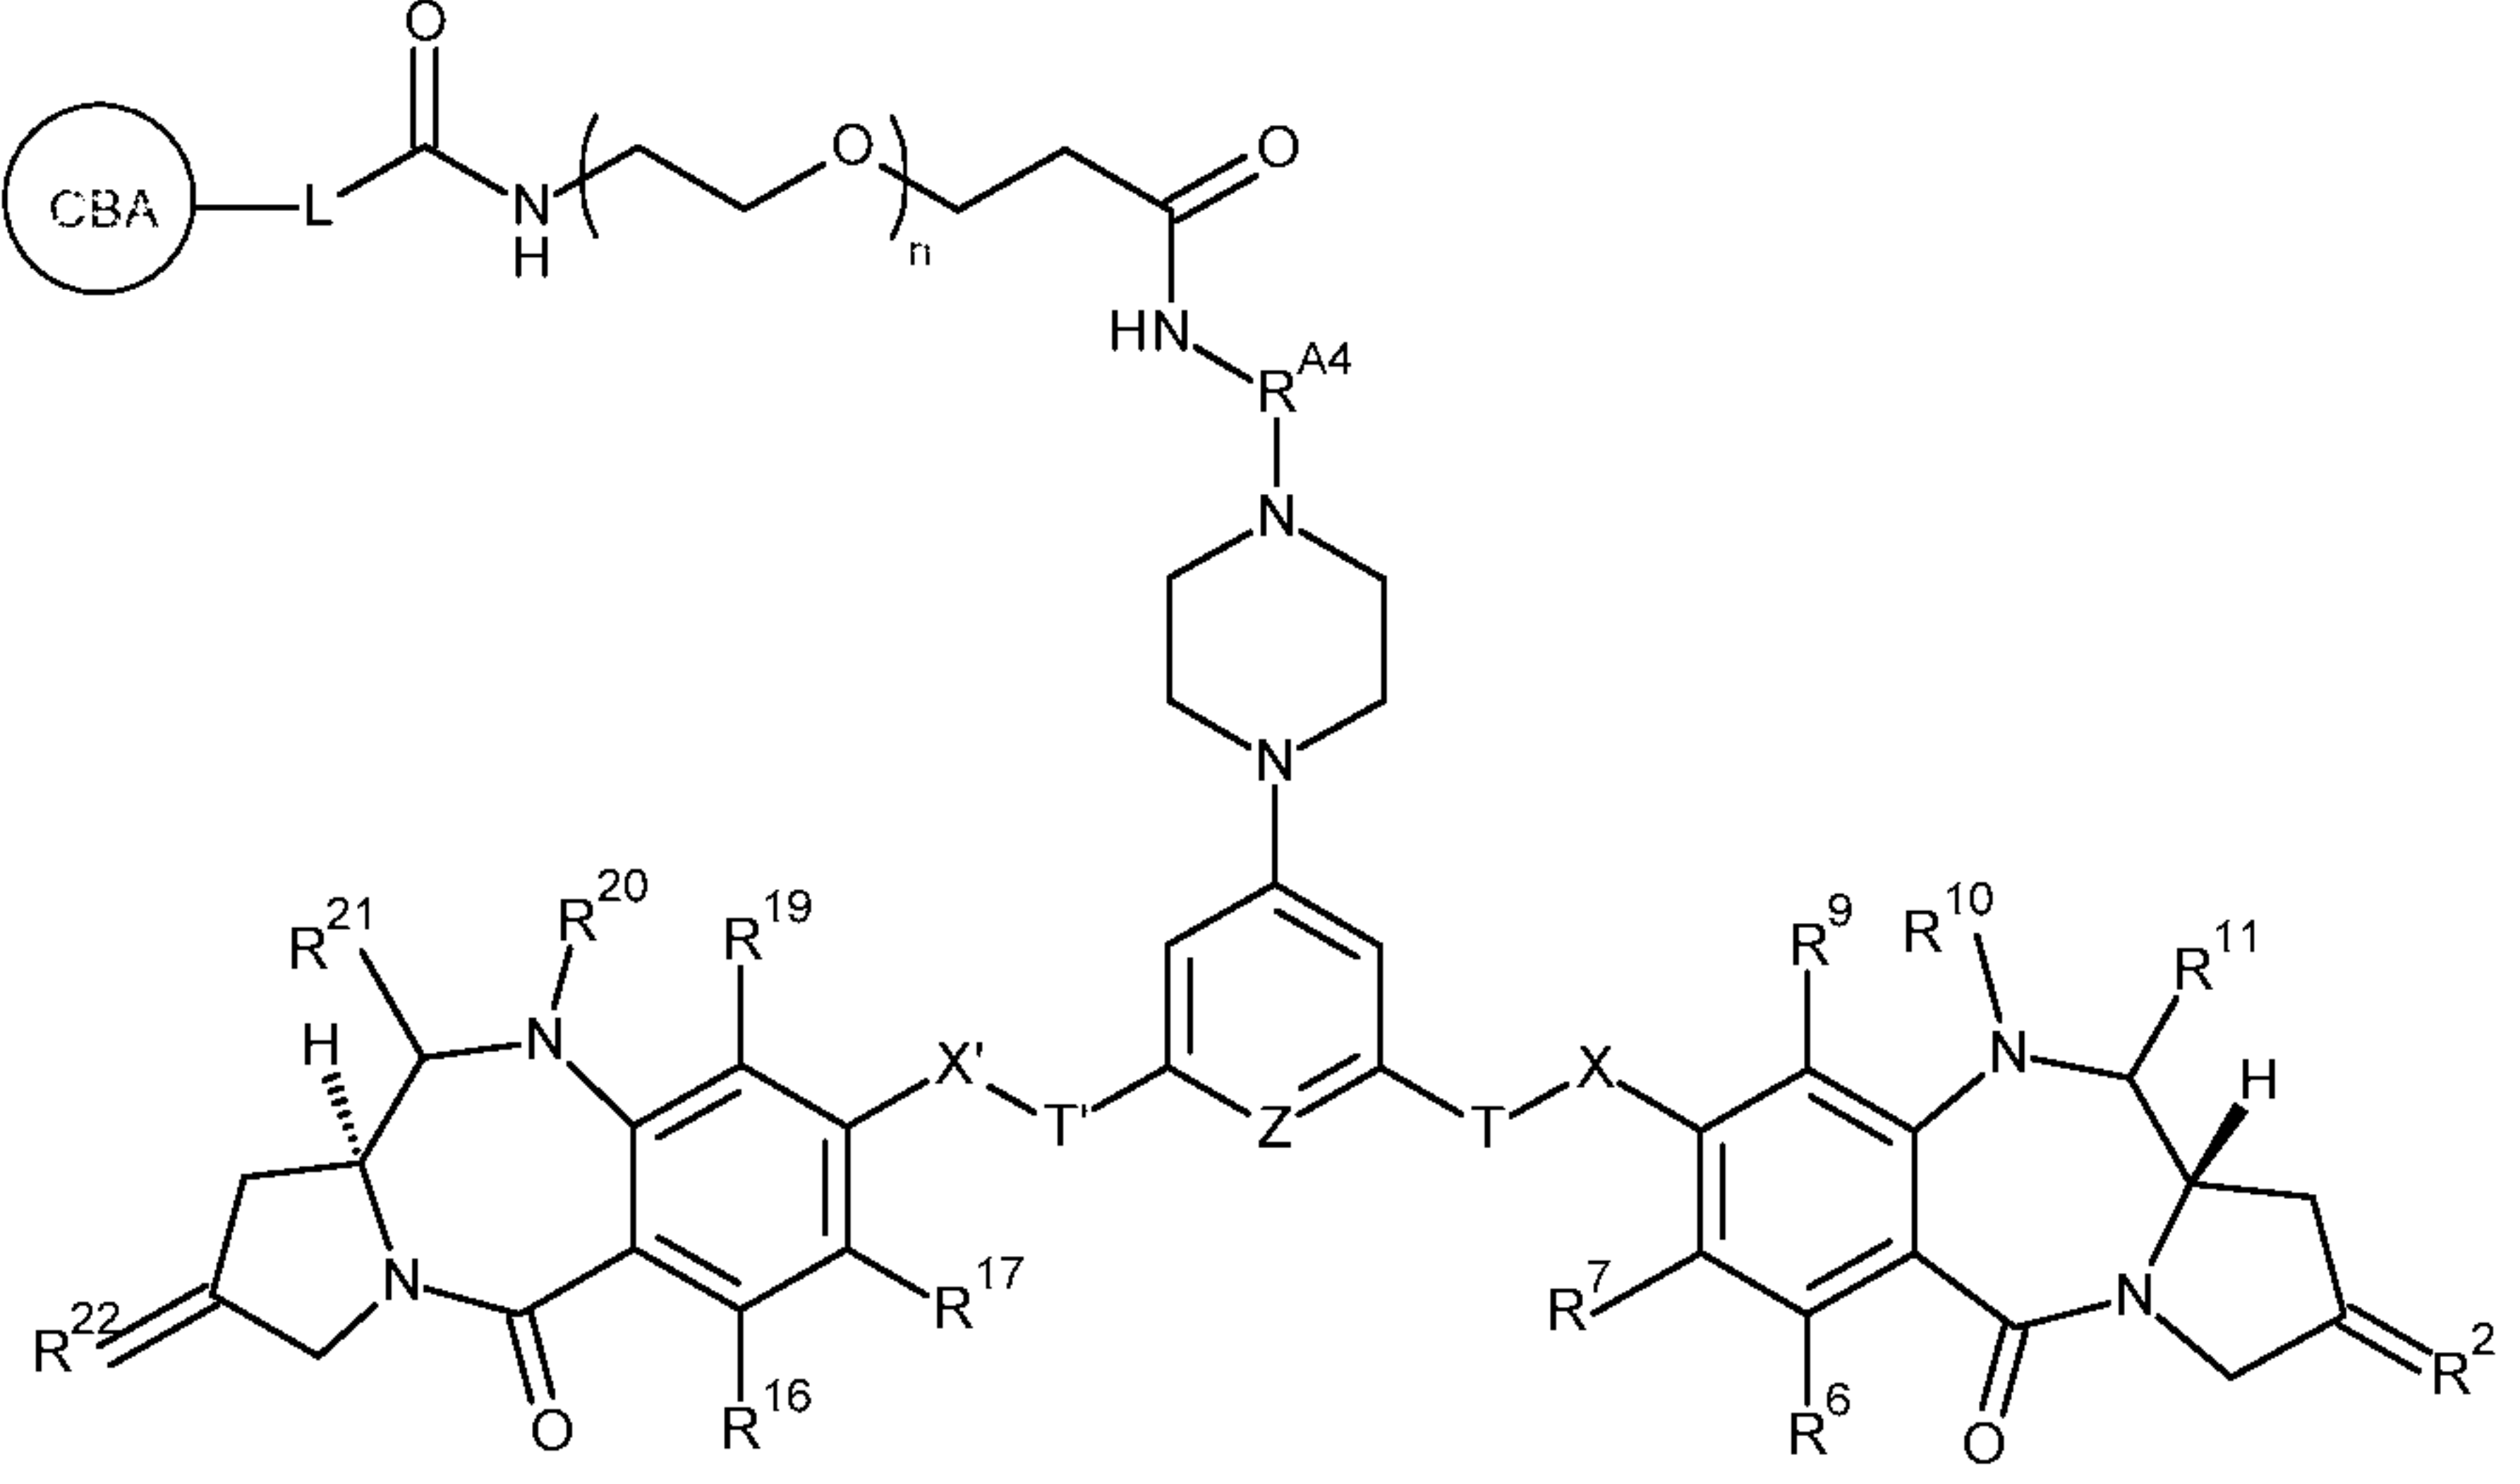

wherein Z is CH or N;

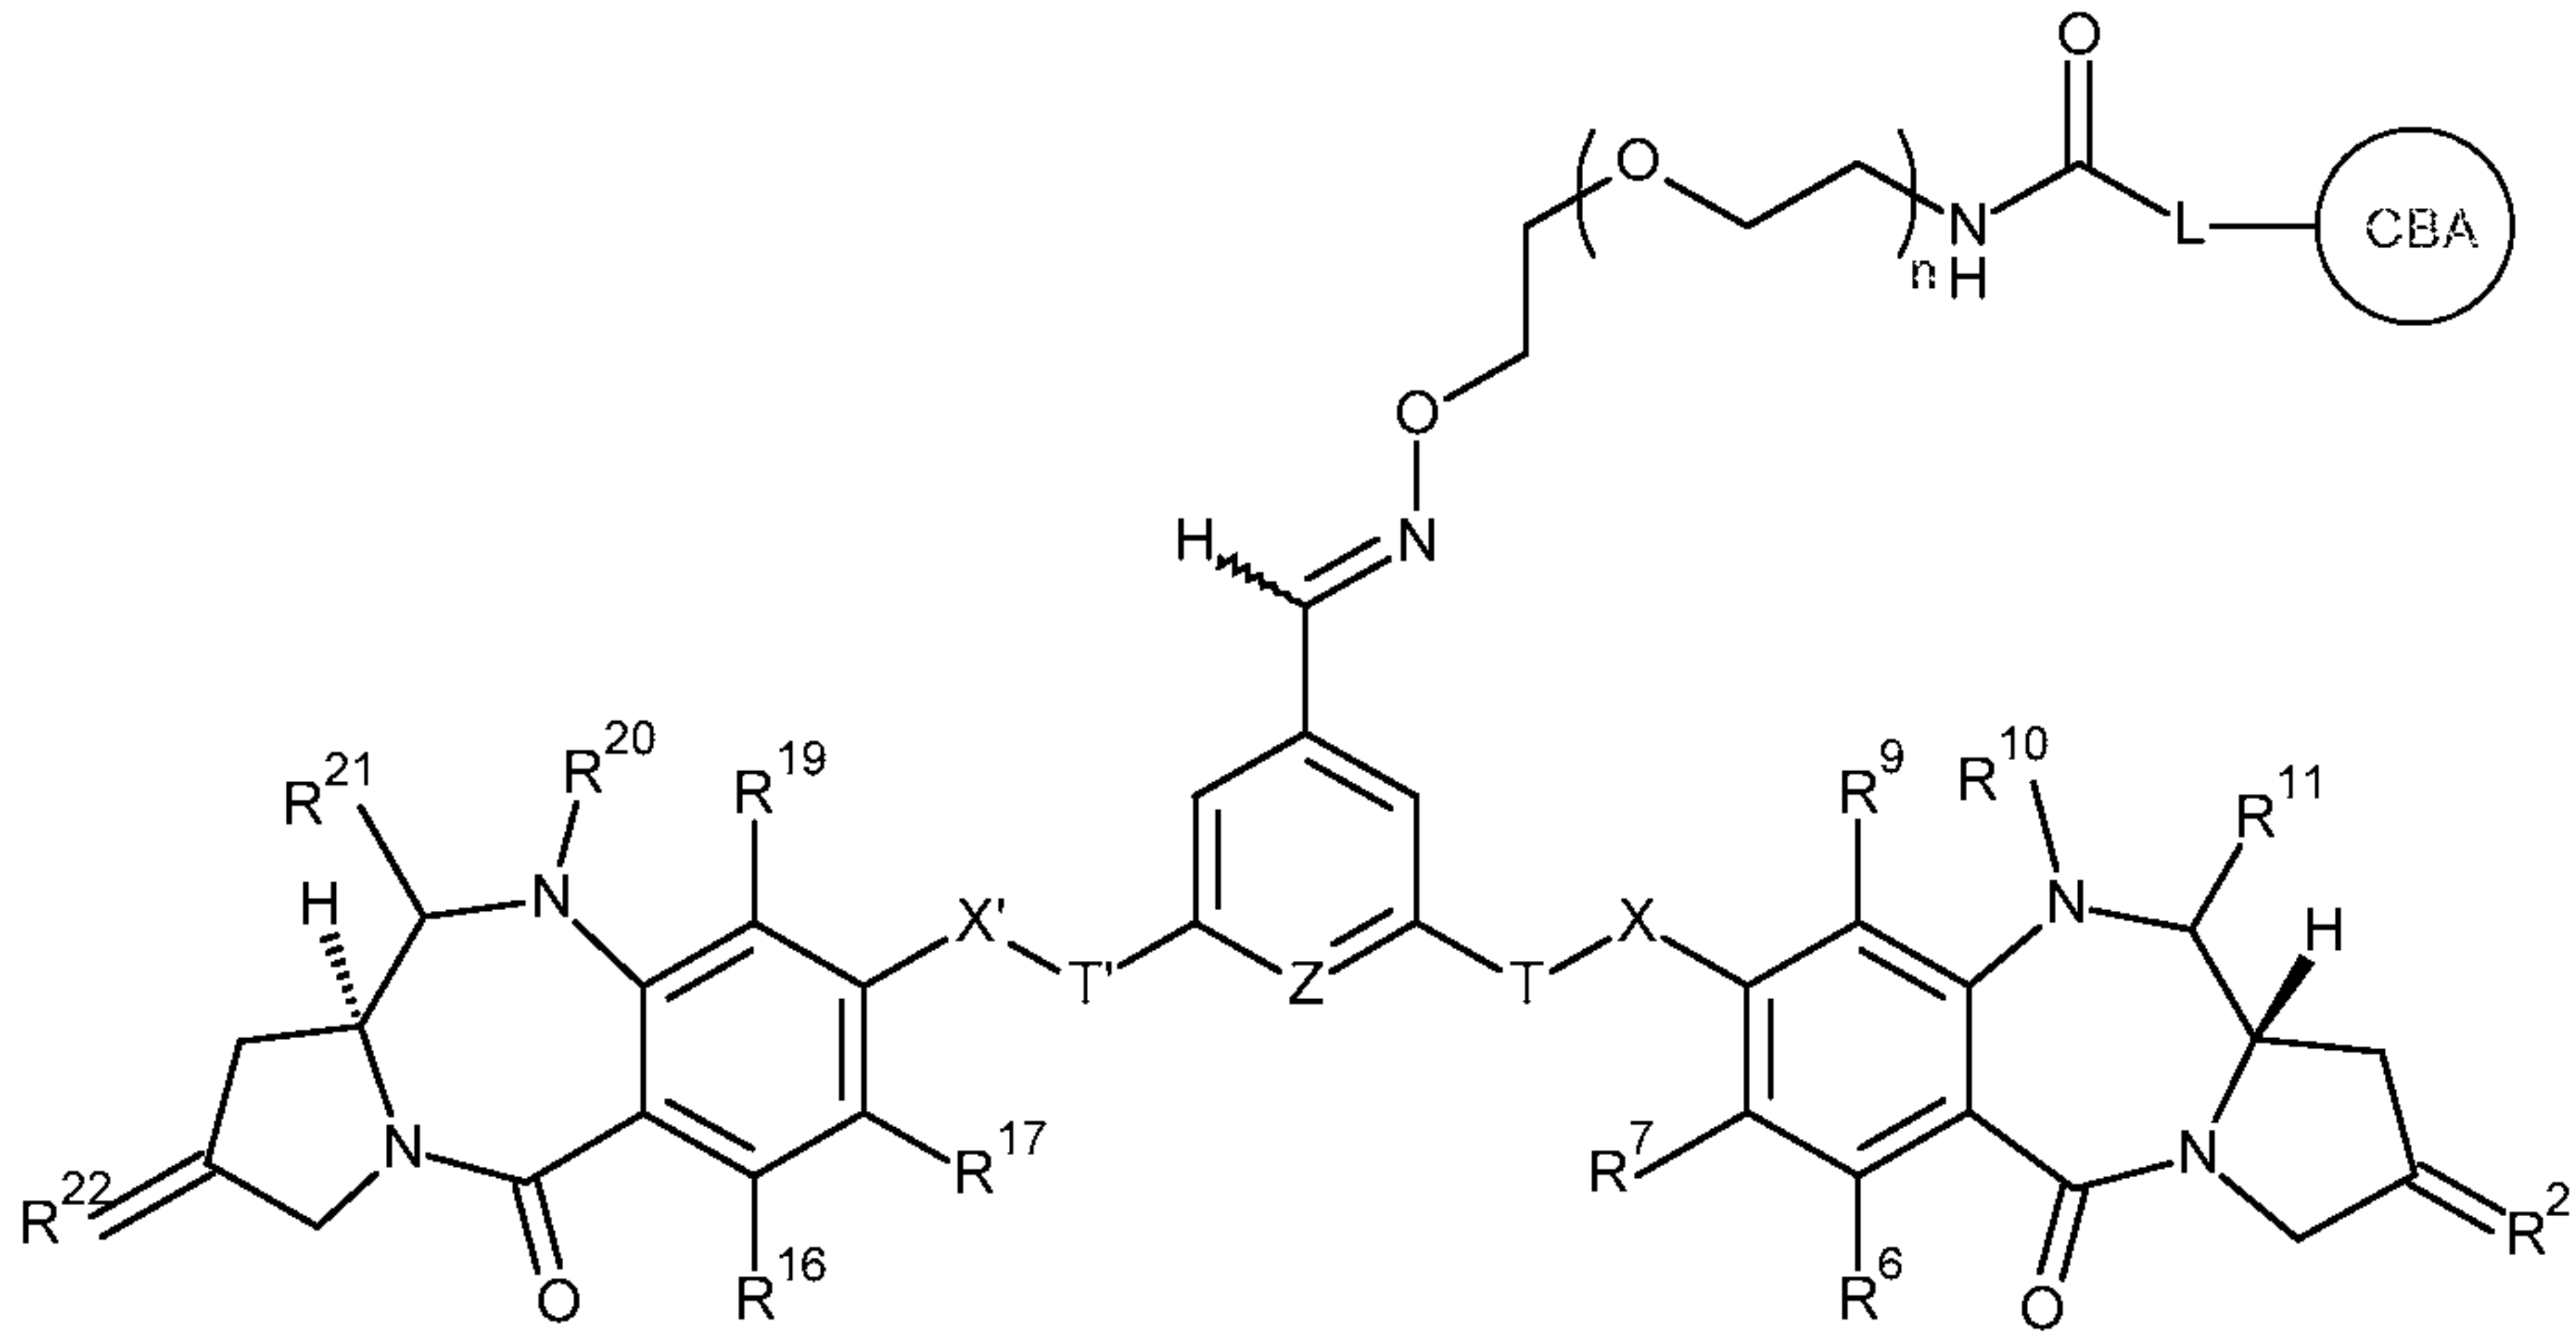

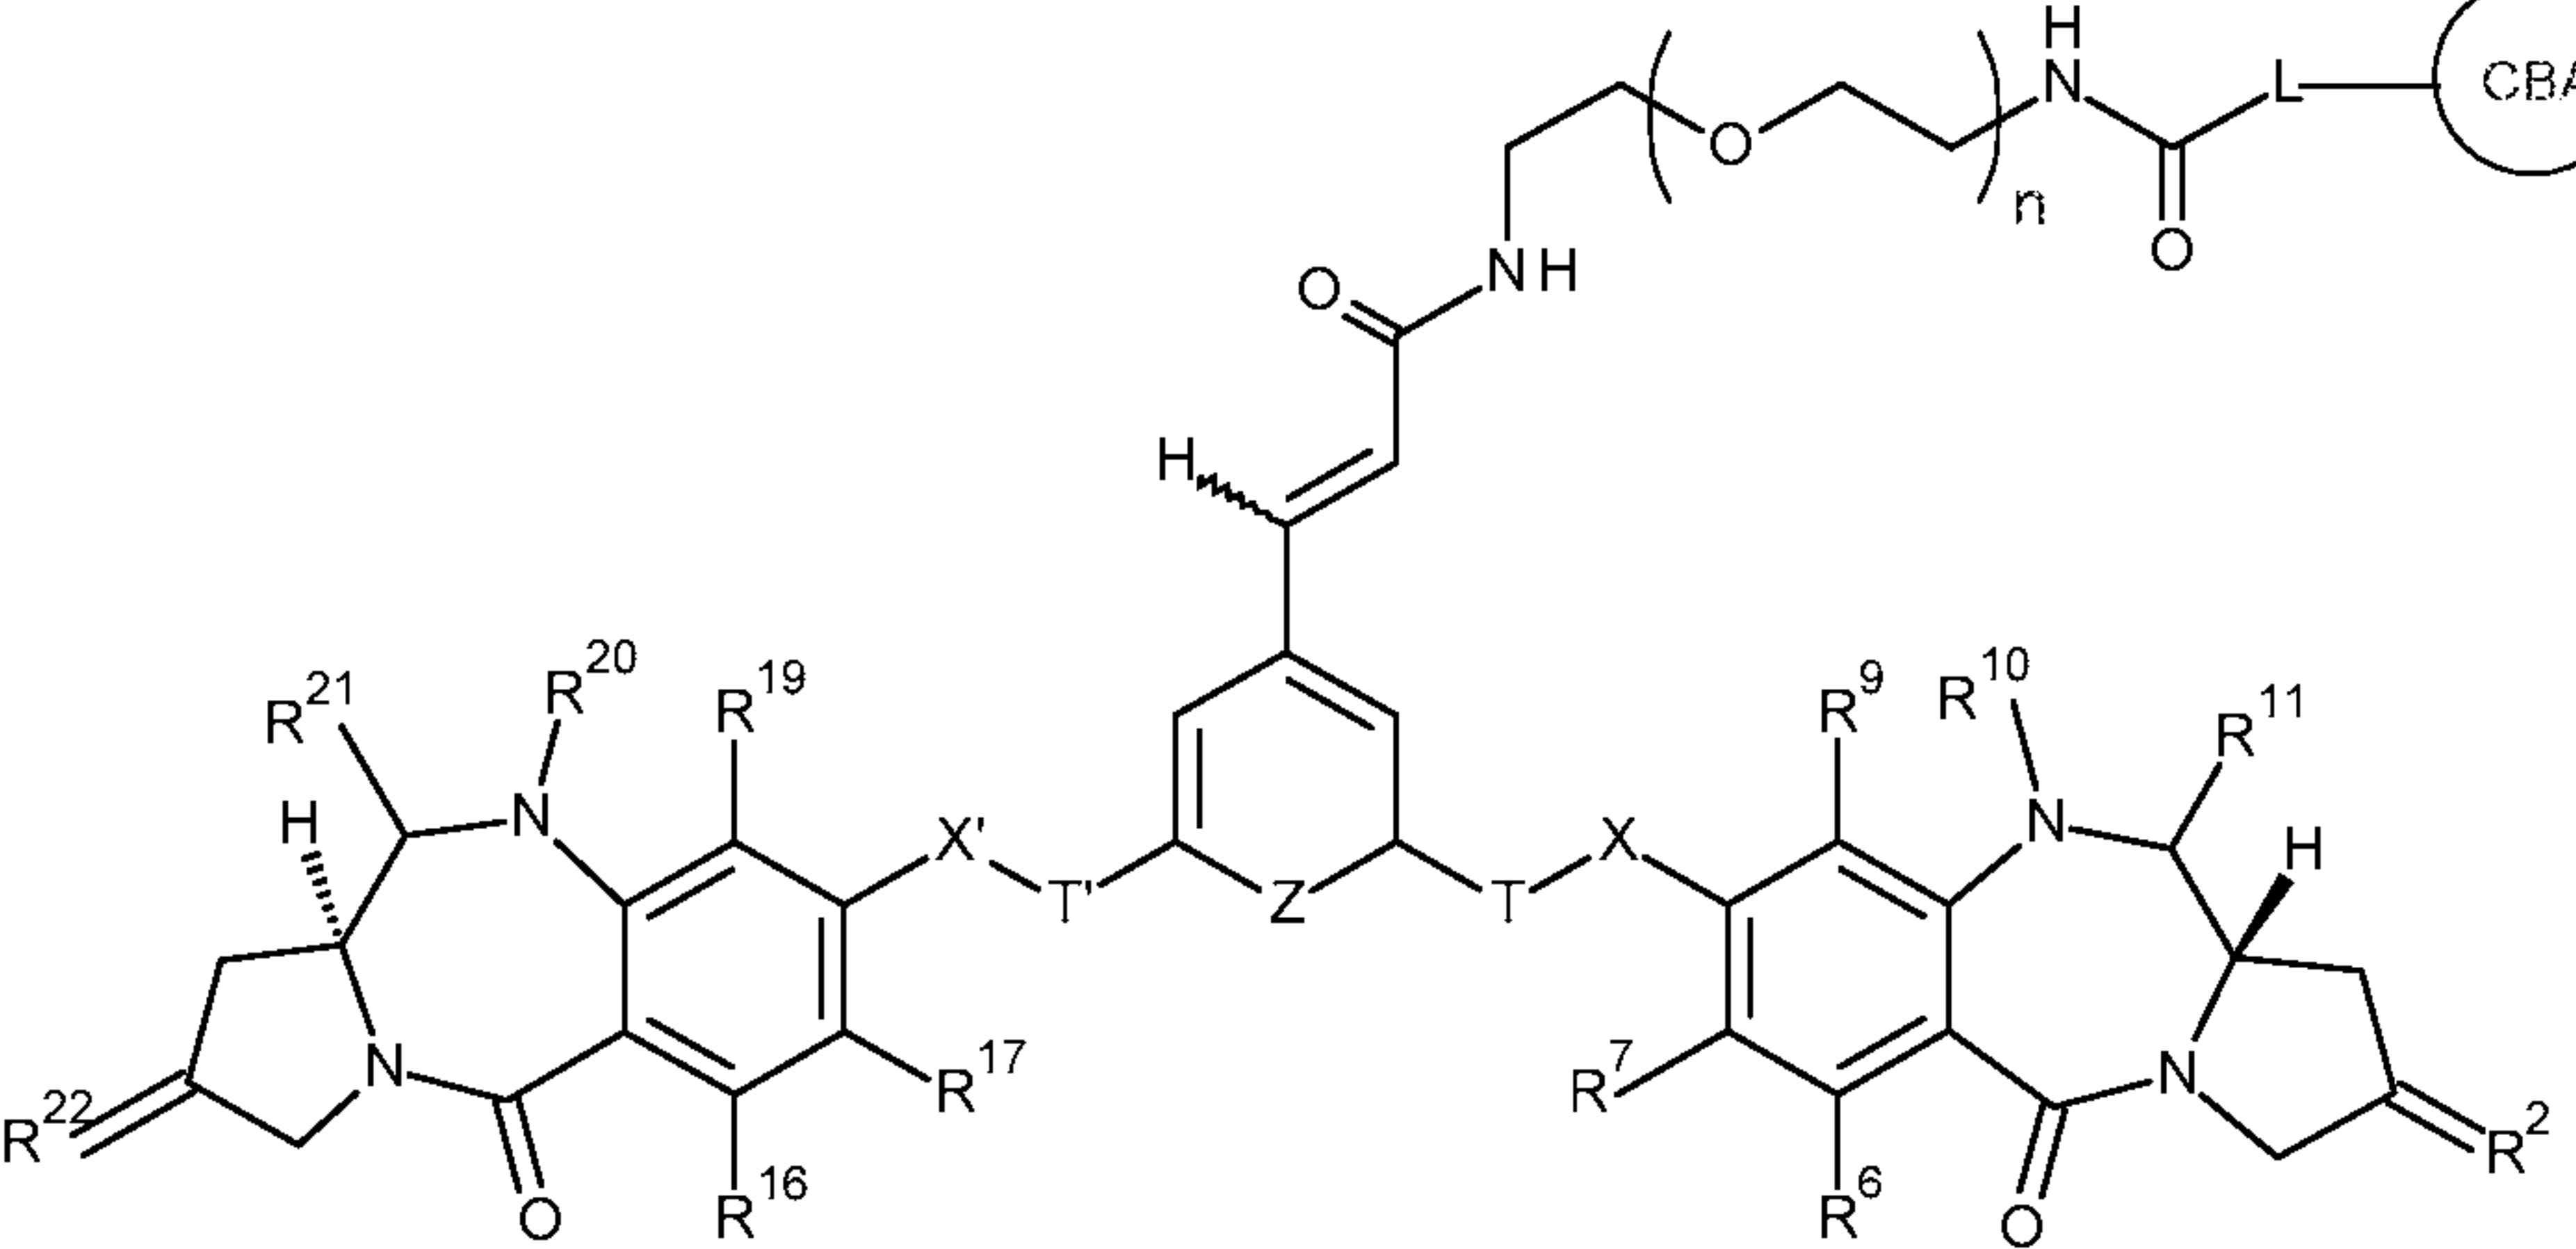

wherein T and T' are independently selected from a single bond or a C₁₋₉ alkylene, which chain may be interrupted by one or more heteroatoms e.g. O, S, N(H), NMe, provided that the number of atoms in the shortest chain of atoms between X and X' is 3 to 12 atoms; and

X and X' are independently selected from O, S and N(H).

Thus formula A is selected from the following formulae A-I, A-II, A-III, A-IV, A-V and A-VI depending on Y:

Y	A
A1	 <p style="text-align: center;">(A-I)</p>

Y	A
A2	 <p style="text-align: center;">(A-II)</p>
A3	 <p style="text-align: center;">(A-III)</p>
A4	 <p style="text-align: center;">(A-IV)</p>

Y	A
A5	 <p style="text-align: center;">(A-V)</p>
A6	

A second aspect of the present invention provides novel drug-linker compounds of formula (B):

Where all the groups are as defined in the first aspect of the invention; and

Y^L is selected from a group of formulae B1, B2, B3, B4, B5 and B6:

9

(B1)

(B2)

(B3)

(B4)

(B5)

(B6)

where G is a reactive group for connecting to a cell binding agent.

A third aspect of the present invention provides compounds of formula (C) which may be used in the preparation of the compounds and conjugate compounds of the invention:

where Y^C is selected from a group of formulae C1, C2, C3, C4 and C5:

(C1)

(C2)

(C3)

(C4)

(C5)

(C6)

either

- (a) R^{30} is H, and R^{31} is OH, OR^A , where R^A is C_{1-4} alkyl; or
- (b) R^{30} and R^{31} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound; or
- (c) R^{30} is H and R^{31} is OSO_zM , where z is 2 or 3 and M is a monovalent pharmaceutically acceptable cation; or
- (d) R^{30} is a nitrogen protecting group and R^{31} is $OProt^O$, where $Prot^O$ is a hydroxy protecting group; and

R^{40} and R^{41} are as defined for R^{30} and R^{31} respectively; and

all the remaining groups are as defined in the first aspect of the invention.

A fourth aspect of the present invention provides compounds of formula (D) which may be used in the preparation of the compounds of the second and third aspects of the invention:

11

Y^D is selected from a group of formulae D2, D3, D4 and D6:

(D2)

(D3)

(D4)

(D6)

and all the remaining groups are as defined in the third aspect of the invention.

A fifth aspect of the present invention provides compounds of formula (E) which may be used in the preparation of the compounds of the second, third and fourth aspects of the invention:

Y^E is selected from a group of formulae E1, E2 and E5:

(E1)

(E2)

(E5)

where

R^{E1} is selected from H and TMS;

R^{E2} is selected from Br, Cl and I; and

all the remaining groups are as defined in the third aspect of the invention.

A sixth aspect of the present invention provides the use of a compound of the first aspect of the invention in a method of medical treatment. The fourth aspect also provides a pharmaceutical composition comprising a compound of the first aspect, and a pharmaceutically acceptable excipient.

A seventh aspect of the present invention provides a compound of the first aspect of the invention or a pharmaceutical composition of the fourth aspect of the invention for use in a method of treatment of a proliferative disease. The fifth aspect also provides the use of a compound of the first aspect in a method of manufacture of a medicament for the treatment of a proliferative disease, and a method of treating a mammal having a proliferative disease, comprising administering an effective amount of a compound of the first aspect or a pharmaceutical composition of the fourth aspect.

An eighth aspect of the present invention provides a method of synthesis of a compound of the first aspect of the present invention, comprising the step of conjugating a drug-linker of the second aspect with a cell-binding agent.

The present invention also provides the synthesis of compounds of the second aspect of the invention from compounds of the third, fourth or fifth aspect of the invention by reacting them with suitable reagents.

Detailed Description of the Invention

The present invention provides a conjugate comprising a PBD dimer connected through the dimer bridging portion via a specified linker to a cell binding agent.

The present invention is suitable for use in providing a PBD conjugate to a preferred site in a subject.

Nitrogen protecting groups

Nitrogen protecting groups are well known in the art. Preferred nitrogen protecting groups for use in the present invention are carbamate protecting groups that have the general formula:

wherein R³⁰ is an optionally substituted alkyl (e.g. C₁₋₂₀ alkyl), aryl (e.g. C₅₋₂₀ aryl) or heteroaryl (e.g. C₃₋₂₀ heterocyclyl) group.

A large number of possible carbamate nitrogen protecting groups are listed on pages 706 to 772 of Greene's Protective Groups in Organic Synthesis, 4th Edition, John Wiley & Sons, Inc., 2007 (ISBN 978-0-471-69754-1), which is incorporated herein by reference.

Particularly preferred protecting groups include Alloc, Troc, Teoc, BOC, TcBOC, Fmoc, 1-Adoc and 2-Adoc.

Hydroxyl protecting groups

Hydroxyl protecting groups are well known in the art. A large number of suitable groups are described on pages 24 to 298 of Greene's Protective Groups in Organic Synthesis, 4th Edition, John Wiley & Sons, Inc., 2007 (ISBN 978-0-471-69754-1), which is incorporated herein by reference.

Classes of particular interest include silyl ethers, methyl ethers, alkyl ethers, benzyl ethers, esters, benzoates, carbonates, and sulfonates. Particularly preferred hydroxyl protecting groups include THP.

Preferences

The following preferences may apply to all aspects of the invention as described above, or may relate to a single aspect. The preferences may be combined together in any combination.

 R^2

In some embodiments, R^{36a} and R^{36b} are both H.

In other embodiments, R^{36a} and R^{36b} are both methyl.

In further embodiments, one of R^{36a} and R^{36b} is H, and the other is selected from C_{1-4} saturated alkyl, C_{2-3} alkenyl, which alkyl and alkenyl groups are optionally substituted. In some of these further embodiments, the group which is not H may be selected from methyl and ethyl.

 R^{22}

The above preferences for R^2 apply equally to R^{22} .

 R^6

In one embodiment, R^6 is independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR', NO_2 , Me_3Sn - and Halo.

In one embodiment, R^6 is independently selected from H, OH, OR, SH, NH_2 , NO_2 and Halo.

In one embodiment, R^6 is independently selected from H and Halo.

In one embodiment, R^6 is independently H.

In one embodiment, R^6 and R^7 together form a group $-O-(CH_2)_p-O-$, where p is 1 or 2.

These embodiments also apply to R^{16} .

 R^7

R^7 is independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR', NO_2 , Me_3Sn and halo.

In one embodiment, R^7 is independently OR.

In one embodiment, R^7 is independently OR^{7A} , where R^{7A} is independently optionally substituted C_{1-6} alkyl.

In one embodiment, R^{7A} is independently optionally substituted saturated C_{1-6} alkyl.

In one embodiment, R^{7A} is independently optionally substituted C_{2-4} alkenyl.

In one embodiment, R^{7A} is independently Me.

In one embodiment, R^{7A} is independently CH_2Ph .

In one embodiment, R^{7A} is independently allyl.

These embodiments also apply to R^{17} .

R^9

In one embodiment, R^9 is independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR', NO_2 , Me_3Sn - and Halo.

In one embodiment, R^9 is independently H.

In one embodiment, R^9 is independently R or OR.

These embodiments also apply to R^{19} .

N10-C11

In some embodiments, R^{10} is H, and R^{11} is OH, OR^A , where R^A is C_{1-4} alkyl. In some of these embodiments, R^{11} is OH. In others of these embodiments, R^{11} is OR^A , where R^A is C_{1-4} alkyl. In some of these embodiments, R^A is methyl.

In some embodiments, R^{10} and R^{11} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound.

In some embodiments, R^{10} is H and R^{11} is OSO_zM , where z is 2 or 3 and M is a monovalent pharmaceutically acceptable cation. In some of these embodiments, M is a monovalent pharmaceutically acceptable cation, and may be Na^+ . Furthermore, in some embodiments z is 3.

The above preferences apply equally to R^{20} and R^{21} .

In some embodiments, R^{30} is H, and R^{31} is OH, OR^A , where R^A is C_{1-4} alkyl. In some of these embodiments, R^{31} is OH. In others of these embodiments, R^{31} is OR^A , where R^A is C_{1-4} alkyl. In some of these embodiments, R^A is methyl.

In some embodiments, R^{30} and R^{31} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound.

In some embodiments, R^{30} is H and R^{31} is OSO_zM , where z is 2 or 3 and M is a monovalent pharmaceutically acceptable cation. In some of these embodiments, M is a monovalent pharmaceutically acceptable cation, and may be Na^+ . Furthermore, in some embodiments z is 3.

In some embodiments, R^{30} is a nitrogen protecting group and R^{31} is $OProt^O$, where $Prot^O$ is a hydroxy protecting group.

In some of these embodiments, the nitrogen protecting group may be selected from Alloc, Troc, Teoc, BOC, TcBOC, Fmoc, 1-Adoc and 2-Adoc, and more preferably be Boc.

In some of these embodiments, the nitrogen protecting group may be THP.

For compounds of formula D, it may be preferred that R^{30} and R^{31} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound.

For compounds of formula E, it may be preferred that R^{30} is a nitrogen protecting group and R^{31} is $OProt^O$, where $Prot^O$ is a hydroxy protecting group.

For compounds of formula C, where Y^C is of formula C2, C3 or C4, it may be preferred that R^{30} and R^{31} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound.

For compounds of formula C, where Y^C is of formula C1 or C5, it may be preferred that R^{30} is a nitrogen protecting group and R^{31} is $OProt^O$, where $Prot^O$ is a hydroxy protecting group.

The above preferences apply equally to R^{40} and R^{41} .

T and T'

Each of T and T' is independently selected from a single bond or a C_{1-9} alkylene group, which chain may be interrupted by one or more heteroatoms, e.g. O, S, N(H) and/or NMe,

provided that the number of atoms in the shortest chain of atoms between X and X' is 3 to 12 atoms.

In one embodiment, each alkylene group of T and T' is optionally interrupted by one or more heteroatoms selected from O, S, and NMe.

In one embodiment, each of T and T' is independently selected from a single bond and a C₁₋₉ alkylene group.

In one embodiment, T is selected from a single bond, C₁, C₂, C₃ and a C₄ alkylene group and T' is selected from a single bond, C₁, C₂, C₃ and a C₄ alkylene group.

In one embodiment, T is selected from a single bond, C₁, and a C₂ alkylene group and T' is selected from a single bond, C₁, and a C₂ alkylene group.

In one embodiment, T is selected from a single bond and a C₁ alkylene group and T' is selected from a single bond and a C₁ alkylene group.

In one embodiment, T is a single bond and T' is a single bond.

In one embodiment, T is a C₁ alkylene group and T' is a C₁ alkylene group.

In some embodiments, T and T' are the same.

The alkylene groups listed above may be optionally interrupted by one or more heteroatoms.

The alkylene groups listed above may be unsubstituted linear aliphatic alkylene groups.

X

In one embodiment, X is selected from O, S, or N(H).

Preferably, X is O.

Dimers

In some embodiments, the groups R²², R¹⁶, R¹⁷, R¹⁹, R²⁰ and R²¹ are the same as the groups R², R⁶, R⁹, R⁷, R¹⁰ and R¹¹ respectively. In these embodiments, the PBD monomer units have the same substituents.

Particularly preferred compounds of the first aspect of the present invention may be of formula Ia:

18

where

R^{10} , R^{11} , R^{20} , R^{21} and Y are as defined above;

t_1 and t_2 are an independently selected from 0, 1 and 2

R^{7a} and R^{17a} are independently selected from methyl and phenyl.

Particularly preferred compounds of the second aspect of the present invention may be of formula IIa:

where

R^{10} , R^{11} , R^{20} , R^{21} and Y^L are as defined above;

t_1 and t_2 are an independently selected from 0, 1 and 2

R^{7a} and R^{17a} are independently selected from methyl and phenyl.

Particularly preferred compounds of the third aspect of the present invention may be of formula IIIa:

where

R^{10} , R^{11} , R^{20} , R^{21} and Y^C are as defined above;

t_1 and t_2 are independently selected from 0, 1 and 2

R^{7a} and R^{17a} are independently selected from methyl and phenyl.

$n(Y, Y^L)$

In some embodiments, n (in Y or Y^L) is an integer between 0 and 24.

In some embodiments, n (in Y or Y^L) is an integer between 0 and 12.

In some embodiments, n (in Y or Y^L) is an integer between 0 and 8.

In some embodiments, n (in Y or Y^L) is an integer between 0 and 6.

In some embodiments, n (in Y or Y^L) is 0.

In some embodiments, n (in Y or Y^L) is 1.

In some embodiments, n (in Y or Y^L) is 2.

In some embodiments, n (in Y or Y^L) is 3.

In some embodiments, n (in Y or Y^L) is 4.

In some embodiments, n (in Y or Y^L) is 5.

In some embodiments, n (in Y or Y^L) is 6.

In some embodiments, n (in Y or Y^L) is 7.

In some embodiments, n (in Y or Y^L) is 8.

In some embodiments, n (in Y or Y^L) is 9.

In some embodiments, n (in Y or Y^L) is 10.

In some embodiments, n (in Y or Y^L) is 11.

In some embodiments, n (in Y or Y^L) is 12.

In some embodiments, n (in Y or Y^L) is 13.

In some embodiments, n (in Y or Y^L) is 14.

In some embodiments, n (in Y or Y^L) is 15.

In some embodiments when Y is A1, or Y^L is B1, n may be selected from 3 and 6.

In some embodiments when Y is A2, or Y^L is B2, n may be selected from 4 and 6.

In some embodiments when Y is A3, or Y^L is B3, n may be 4.

In some embodiments when Y is A4, or Y^L is B4, n may be 4.

In some embodiments when Y is A5, or Y^L is B5, n may be 11.

In some embodiments when Y is A6, or Y^L is B6, n may be 2.

L and G

L is a linker connected to the cell binding agent in the conjugate compound. G is a reactive group for connecting the PBD dimer to the cell binding agent to form the conjugate compound.

Preferably, the linker/reactive group contains an electrophilic functional group for reaction with a nucleophilic functional group on the cell binding agent. Nucleophilic groups on antibodies include, but are not limited to: (i) N-terminal amine groups, (ii) side chain amine groups, e.g. lysine, (iii) side chain thiol groups, e.g. cysteine, and (iv) sugar hydroxyl or amino groups where the antibody is glycosylated. Amine, thiol, and hydroxyl groups are nucleophilic and capable of reacting to form covalent bonds with electrophilic groups on linker moieties and linker reagents including: (i) maleimide groups (ii) activated disulfides, (iii) active esters such as NHS (N-hydroxysuccinimide) esters, HOBt (N-hydroxybenzotriazole) esters, haloformates, and acid halides; (iv) alkyl and benzyl halides such as haloacetamides; and (v) aldehydes, ketones, carboxyl, and, some of which are exemplified as follows:

Certain antibodies have reducible interchain disulfides, i.e. cysteine bridges. Antibodies may be made reactive for conjugation with linker reagents by treatment with a reducing agent such as DTT (dithiothreitol). Each cysteine bridge will thus form, theoretically, two reactive thiol nucleophiles. Additional nucleophilic groups can be introduced into antibodies through

the reaction of lysines with 2-iminothiolane (Traut's reagent) resulting in conversion of an amine into a thiol. Reactive thiol groups may be introduced into the antibody (or fragment thereof) by introducing one, two, three, four, or more cysteine residues (e.g., preparing mutant antibodies comprising one or more non-native cysteine amino acid residues). US 7521541 teaches engineering antibodies by introduction of reactive cysteine amino acids. In some embodiments, a Linker has a reactive nucleophilic group which is reactive with an electrophilic group present on an antibody. Useful electrophilic groups on an antibody include, but are not limited to, aldehyde and ketone carbonyl groups. The heteroatom of a nucleophilic group of a Linker can react with an electrophilic group on an antibody and form a covalent bond to an antibody unit. Useful nucleophilic groups on a Linker include, but are not limited to, hydrazide, oxime, amino, hydroxyl, hydrazine, thiosemicarbazone, hydrazine carboxylate, and arylhydrazide. The electrophilic group on an antibody provides a convenient site for attachment to a Linker.

In one embodiment, the group L is:

where the asterisk indicates the point of attachment to the rest of group Y, the wavy line indicates the point of attachment to the cell binding agent, and m is an integer selected from the range 0 to 6. In one embodiment, m is selected from 2, 3, 4 and 5.

In one embodiment, the connection between the cell binding agent and L is through a thiol residue of the cell binding agent and a maleimide group of L.

In one embodiment, the connection between the cell binding agent and L is:

where the asterisk indicates the point of attachment to the remaining portion of the L group or the remaining portion of the Y group and the wavy line indicates the point of attachment to the remaining portion of the cell binding agent. In this embodiment, the S atom is typically derived from the cell binding agent.

In each of the embodiments above, an alternative functionality may be used in place of the maleimide-derived group shown below:

where the wavy line indicates the point of attachment to the cell binding agent as before, and the asterisk indicates the bond to the remaining portion of the L group or the remaining portion of the Y group.

In one embodiment, the maleimide-derived group is replaced with the group:

where the wavy line indicates point of attachment to the cell binding agent, and the asterisk indicates the bond to the remaining portion of the L group or the remaining portion of the Y group.

In one embodiment, the maleimide-derived group is replaced with a group, which optionally together with the cell binding agent, is selected from:

- C(=O)NH-
- C(=O)O-
- NHC(=O)-
- OC(=O)-
- OC(=O)O-
- NHC(=O)O-
- OC(=O)NH-
- NHC(=O)NH-
- NHC(=O)NH
- C(=O)NHC(=O)-
- S-
- S-S-
- CH₂C(=O)-
- C(=O)CH₂-

=N-NH-, and
-NH-N=.

In one embodiment, the maleimide-derived group is replaced with a group, which optionally together with the cell binding agent, is selected from:

where the wavy line indicates either the point of attachment to the cell binding agent or the bond to the remaining portion of the L group or the remaining portion of the Y group, and the asterisk indicates the other of the point of attachment to the cell binding agent or the bond to the remaining portion of the L group or the remaining portion of the Y group.

Other groups that can be used as L for connecting the remaining portion of the Y group to the cell binding agent are described in WO 2005/082023.

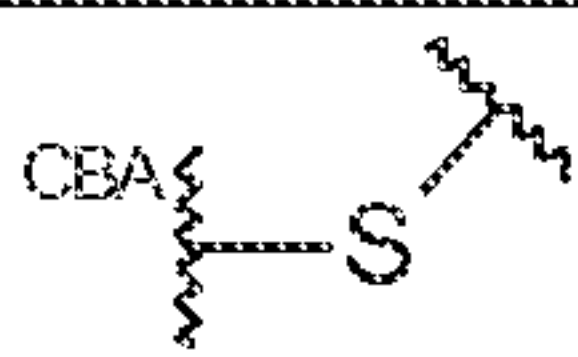

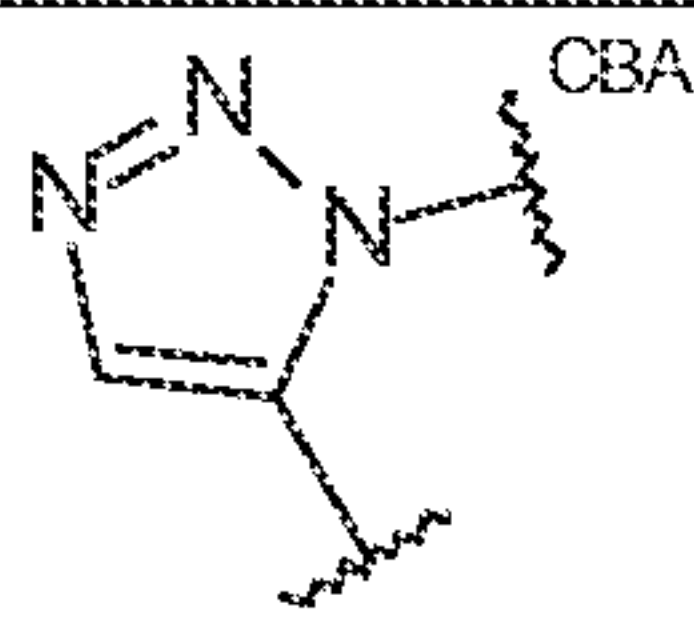

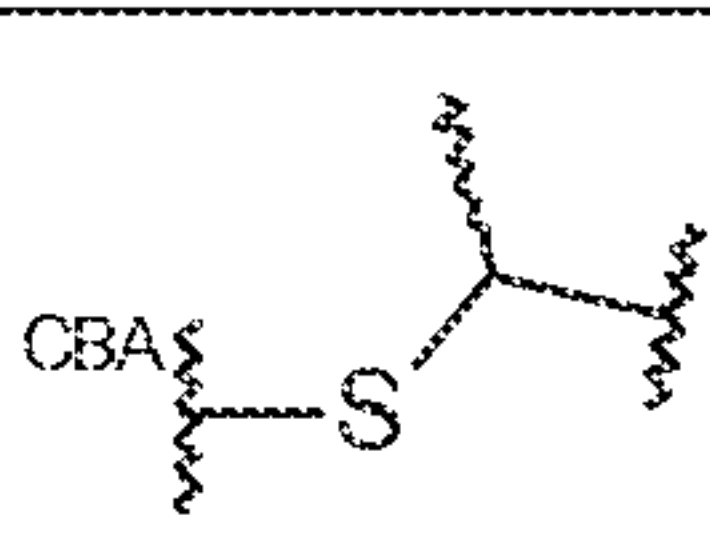

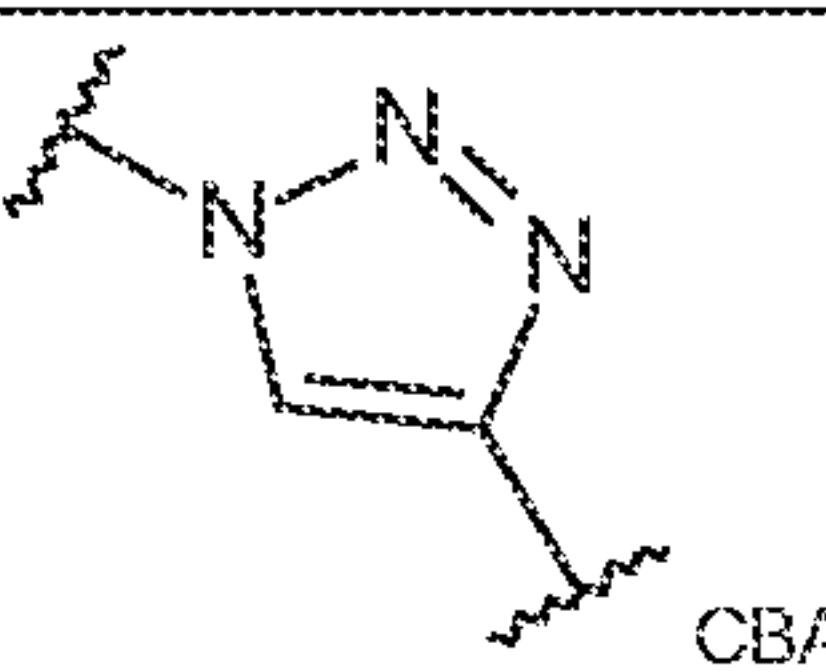

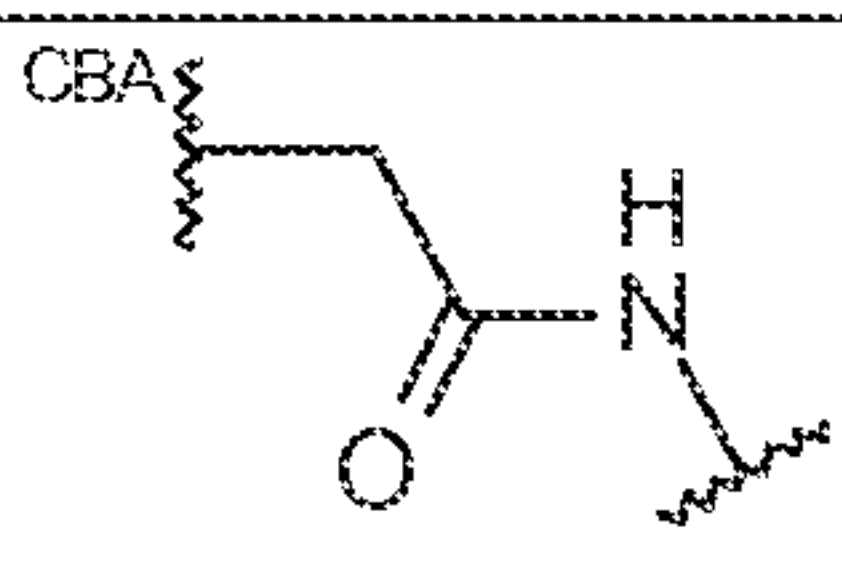

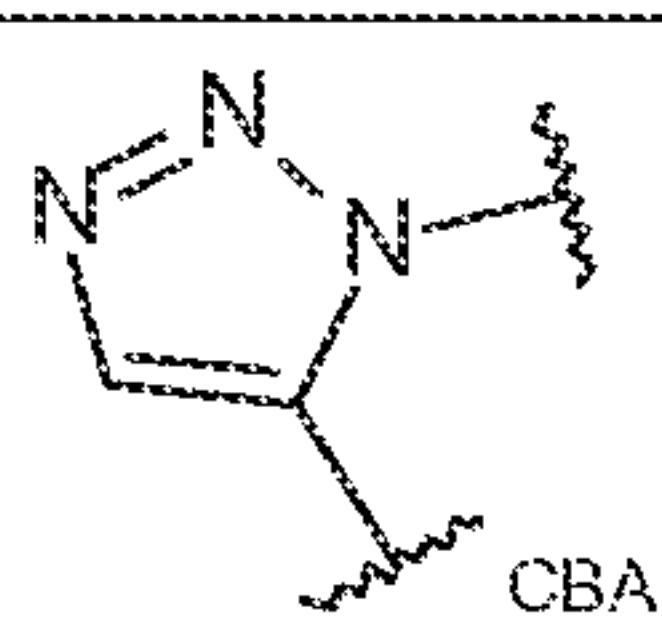

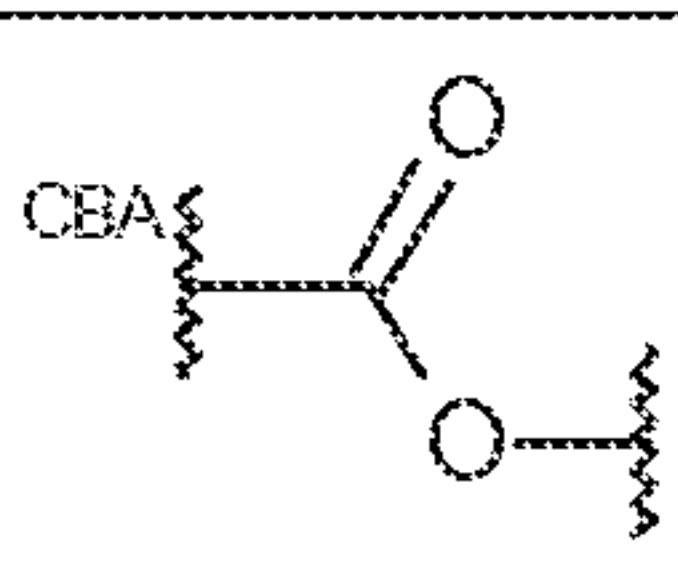

Thus, in embodiments of the present invention, L is of formula:

Where m is from 0 to 6; and

L^A is selected from:

(L^{A1-1})		(L^{A6})	
(L^{A1-2})		(L^{A7})	
(L^{A2})		(L^{A8-1})	

(L ^{A3-1})		(L ^{A8-2})	
(L ^{A3-2})		(L ^{A9-1})	
(L ^{A4})		(L ^{A9-2})	
(L ^{A5})			

where Ar is C₅₋₆ arylene group, e.g. phenylene.

In some embodiments where L is L1, m may be 2, 3 or 5.

In some embodiments where L is L1, L^A may be L^{A1-1}.

In embodiments of the present invention, L is of formula:

Where m is from 0 to 6; and

L^A is selected from the groups above.

Without wishing to be bound by theory, such a group may be cleaved from the antibody such that the carbamate group yields a terminal amine.

In some embodiments where L is L2, L^A may be L^{A3-2}.

In some embodiments where L is L2, m may be 1.

In embodiments of the present invention, L is of formula:

Where q is from 1 to 3, and p is from 1 to 3; and

L^A is selected from the groups above.

Without wishing to be bound by theory, such a group may be cleaved from the antibody such that the carbamate group yields the group: $\text{H}_2\text{N}-(\text{CH}_2)_p-$ (L3').

In some embodiments where L is L3, q may be 1, and p may be 2.

In some embodiments where L is L3, L^A may be selected from L^{A7} , L^{A8-1} and L^{A8-2} .

In embodiments of the present invention, L is of formula:

Where m is from 0 to 6;

X^1 and X^2 are amino acid groups, selected from natural amino acids, which may be modified;
 L^A is selected from the groups above.

The natural amino acids may be selected such that the dipeptide group is cathpesin labile.

In one embodiment, the group $-X_1-X_2-$ is selected from:

- Phe-Lys-,
- Val-Ala-,
- Val-Lys-,
- Ala-Lys-,
- Val-Cit-,
- Phe-Cit-,
- Leu-Cit-,
- Ile-Cit-,
- Phe-Arg-,
- Trp-Cit-

where Cit is citrulline.

Preferably, the group $-X_1-X_2-$ is selected from:

- Phe-Lys-,
- Val-Ala-,
- Val-Lys-,

-Ala-Lys-,

-Val-Cit-.

Most preferably, the group $-X_1-X_2-$ is -Phe-Lys- or -Val-Ala-.

In some embodiments where L is L4, m may be 1.

Other dipeptide combinations may be used, including those described by Dubowchik *et al.*, *Bioconjugate Chemistry*, 2002, 13,855-869, which is incorporated herein by reference.

In one embodiment, the amino acid side chain is derivatised, where appropriate. For example, an amino group or carboxy group of an amino acid side chain may be derivatised.

In one embodiment, an amino group NH_2 of a side chain amino acid, such as lysine, is a derivatised form selected from the group consisting of NHR and NRR' .

In one embodiment, a carboxy group $COOH$ of a side chain amino acid, such as aspartic acid, is a derivatised form selected from the group consisting of $COOR$, $CONH_2$, $CONHR$ and $CONRR'$.

In one embodiment, the amino acid side chain is chemically protected, where appropriate.

The side chain protecting group may be a group as discussed below in relation to the group R^L . The present inventors have established that protected amino acid sequences are cleavable by enzymes. For example, it has been established that a dipeptide sequence comprising a Boc side chain-protected Lys residue is cleavable by cathepsin.

Protecting groups for the side chains of amino acids are well known in the art and are described in the Novabiochem Catalog. Additional protecting group strategies are set out in *Protective Groups in Organic Synthesis*, Greene and Wuts.

Possible side chain protecting groups are shown below for those amino acids having reactive side chain functionality:

Arg: Z, Mtr, Tos;

Asn: Trt, Xan;

Asp: Bzl, t-Bu;

Cys: Acm, Bzl, Bzl-OMe, Bzl-Me, Trt;

Glu: Bzl, t-Bu;

Gln: Trt, Xan;

His: Boc, Dnp, Tos, Trt;

Lys: Boc, Z-Cl, Fmoc, Z, Alloc;

Ser: Bzl, TBDMS, TBDPS;

Thr: Bz;

Trp: Boc;

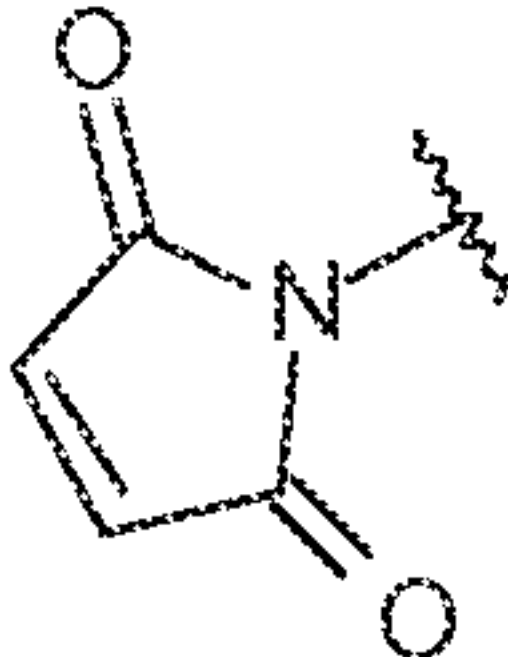

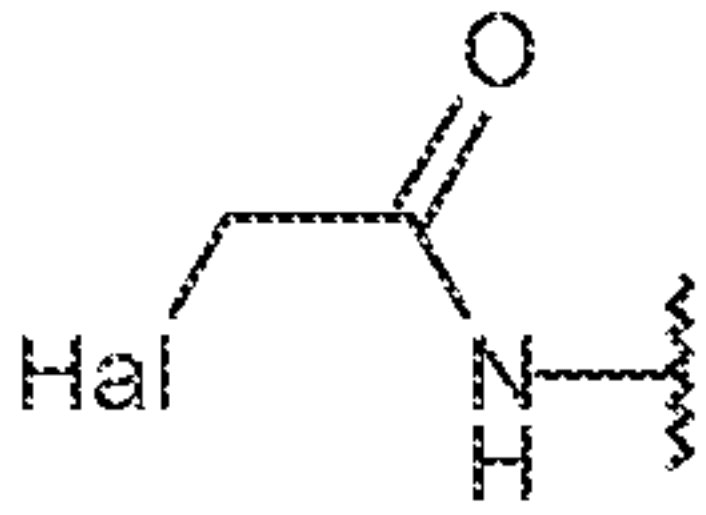

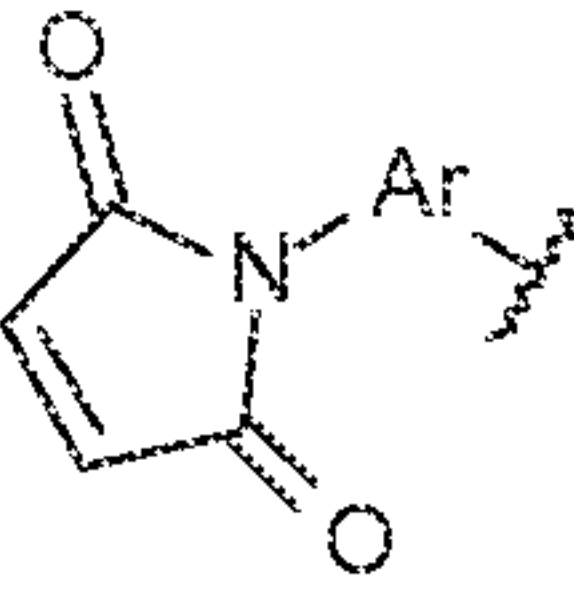

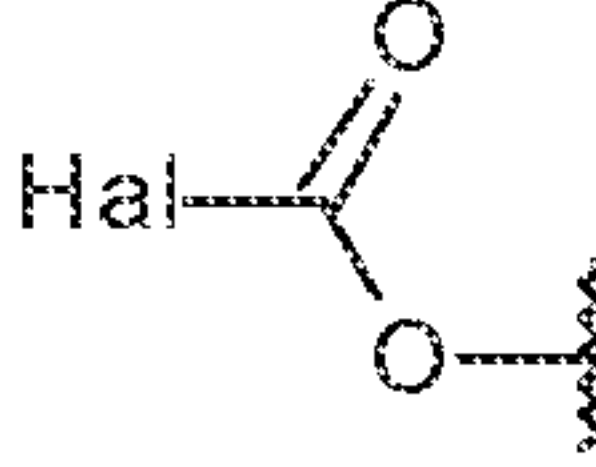

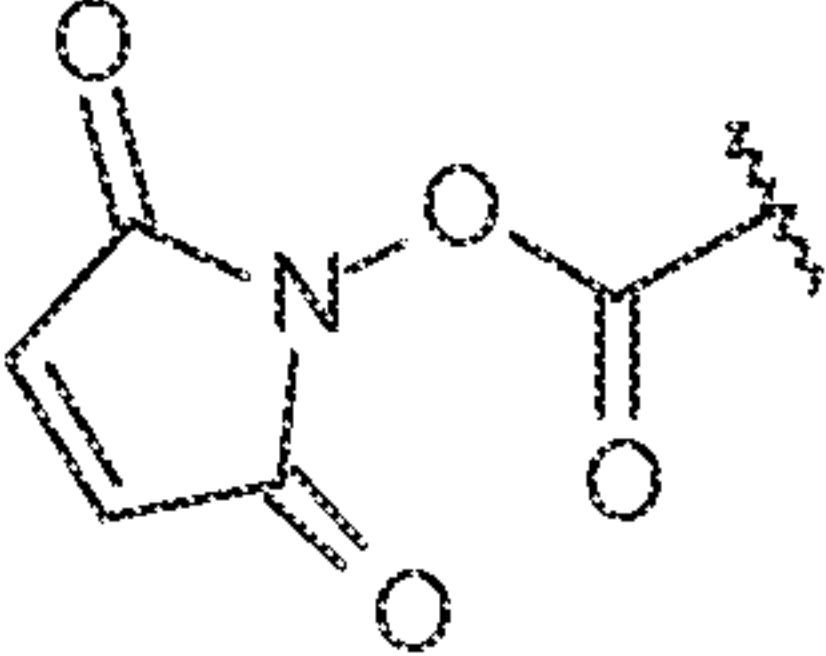

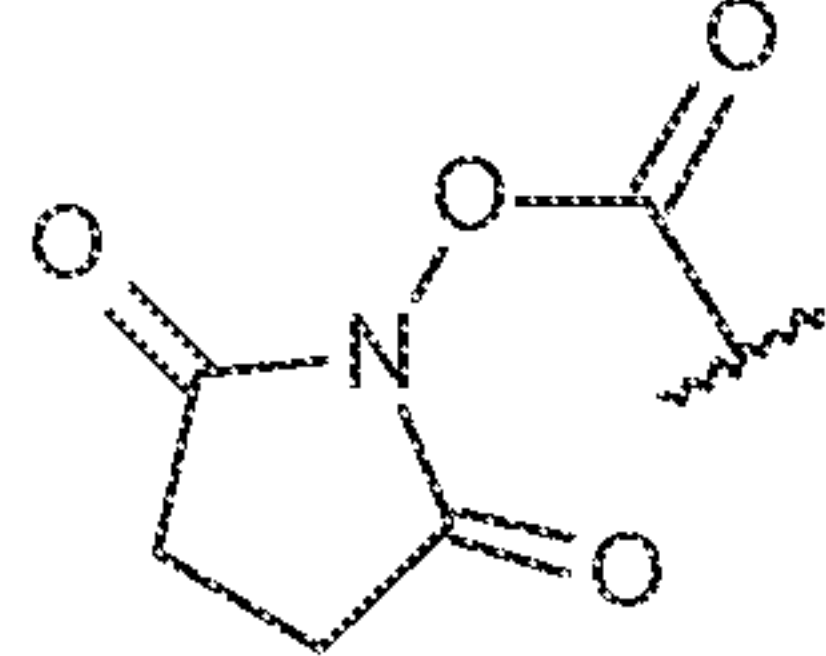

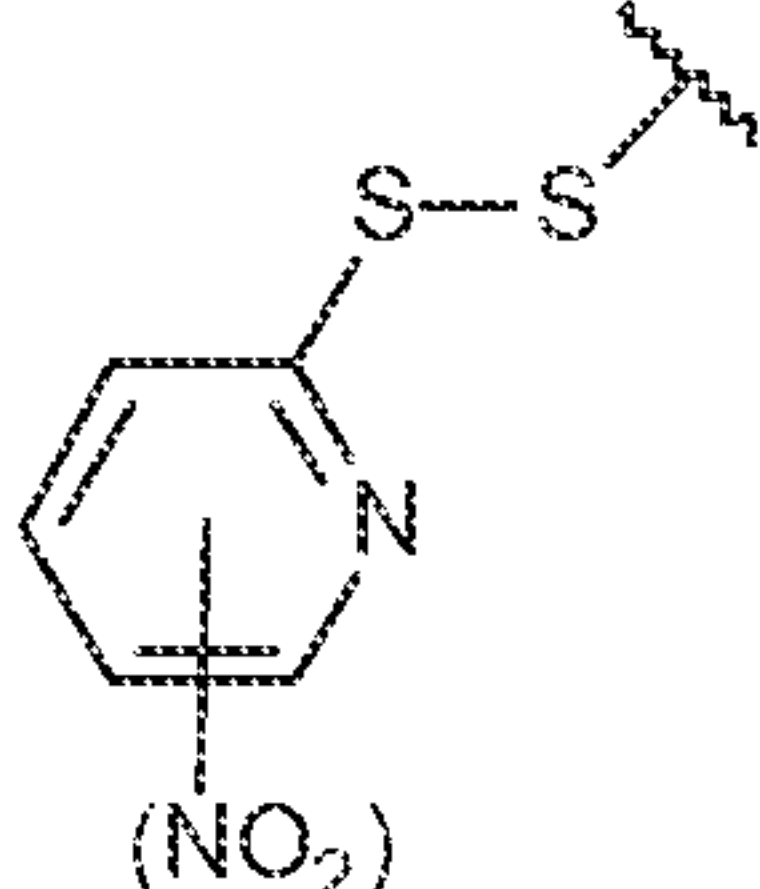

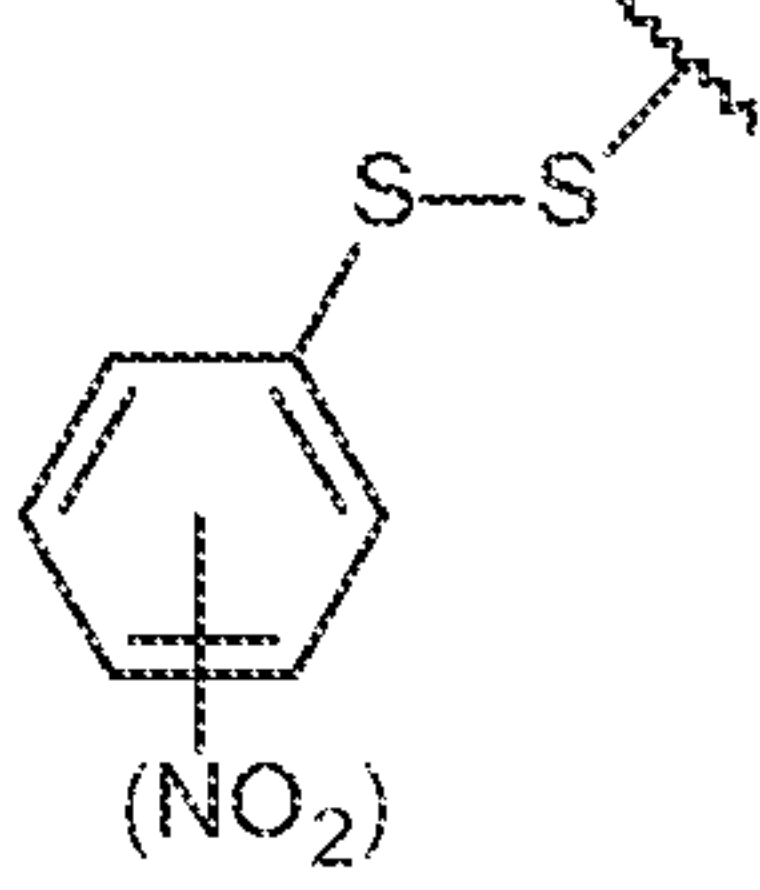

Tyr: Bzl, Z, Z-Br.

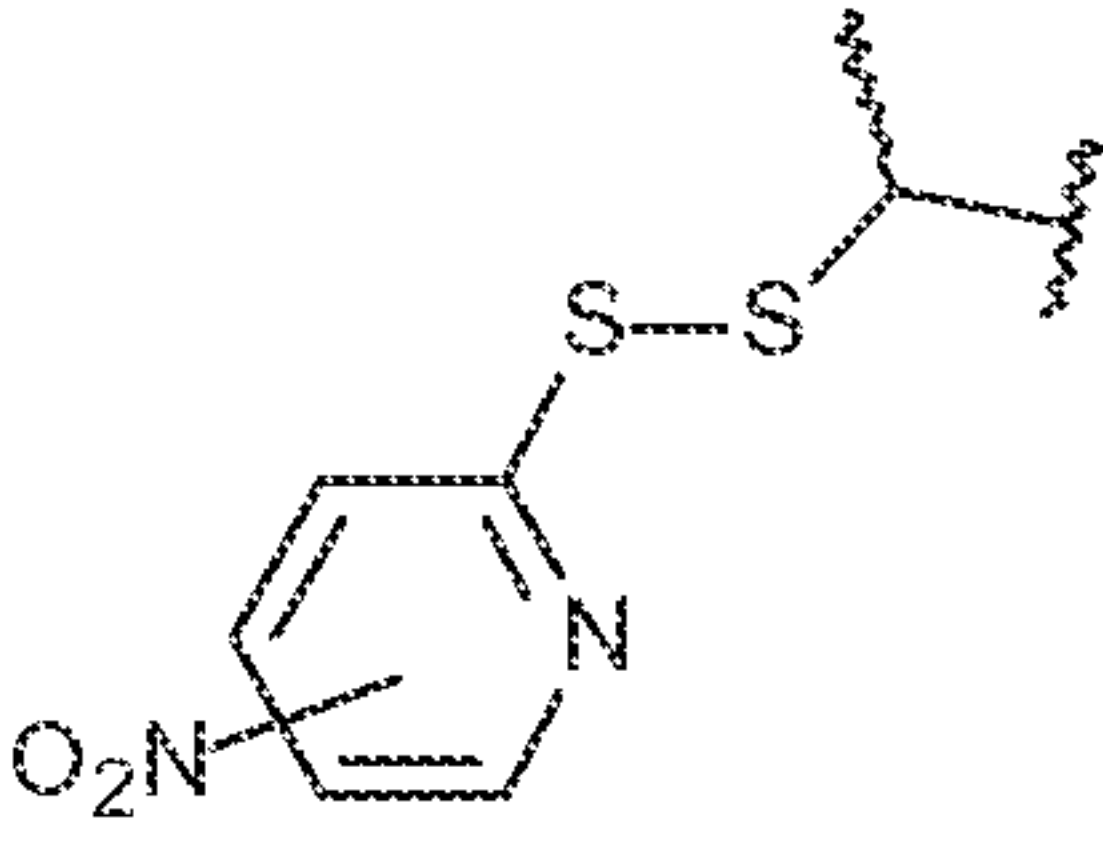

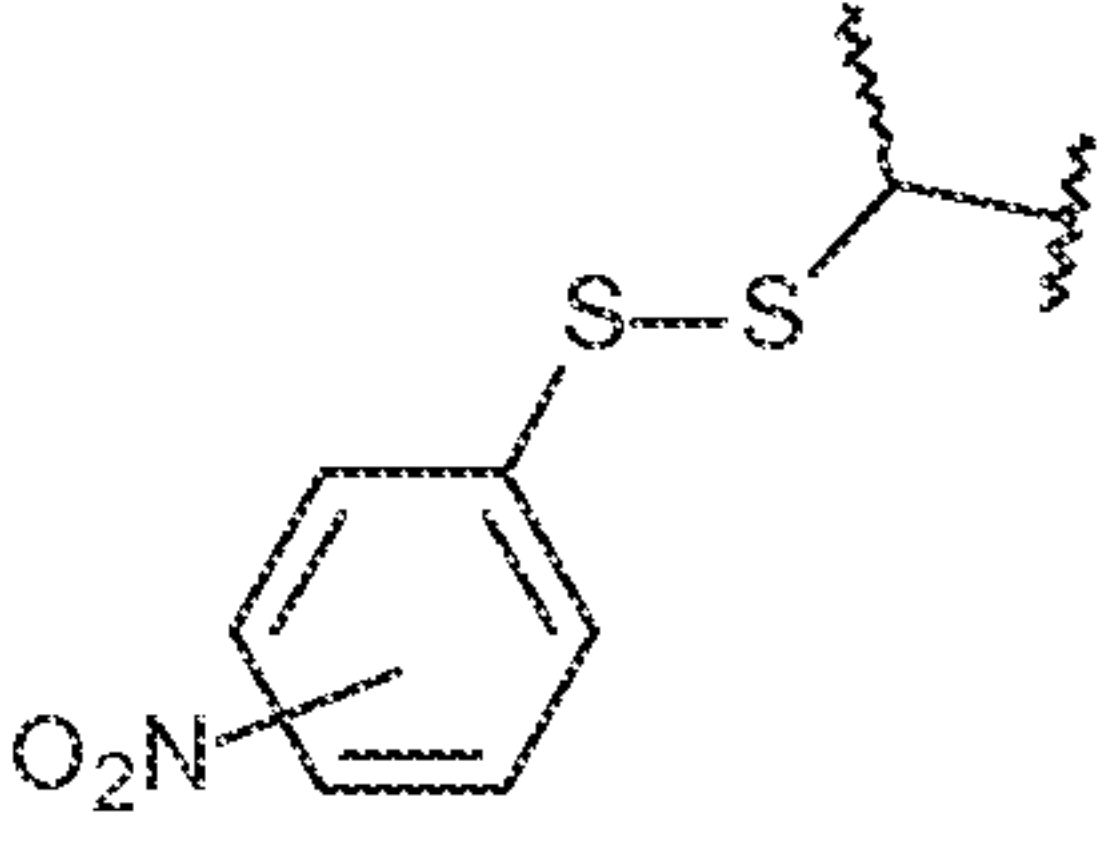

Thus, in embodiments of the present invention, G is of formula:

Where m is from 0 to 6; and

G^A is selected from:

(G^{A1-1})		(G^{A4})	 <p>Where Hal = I, Br, Cl</p>
(G^{A1-2})		(G^{A5})	
(G^{A2})		(G^{A6})	
(G^{A3-1})	 <p>where the NO₂ group is optional</p>	(G^{A7})	
(G^{A3-2})	 <p>where the NO₂ group is optional</p>	(G^{A8})	

(G ^{A3-3})	 <p>where the NO₂ group is optional</p>	(G ^{A9})	
(G ^{A3-4})	 <p>where the NO₂ group is optional</p>		

where Ar represents a C₅₋₆ arylene group, e.g. phenylene.

In some embodiments where G is G1, m may be 2, 3 or 5.

In some embodiments where G is G1, G^A may be G^{A1-1}.

In embodiments of the present invention, G is of formula:

Where m is from 0 to 6; and

G^A is selected from the groups above.

In some embodiments where G is G2, G^A may be G^{A3-2}.

In some embodiments where G is G2, m may be 1.

In embodiments of the present invention, G is of formula:

Where q is from 1 to 3, and p is from 1 to 3; and

G^A is selected from the groups above.

In some embodiments where G is G3, q may be 1, and p may be 2.

In some embodiments where G is G3, G^A may be selected from G^{A7} and G^{A8}.

In embodiments of the present invention, G is of formula:

Where m is from 0 to 6;

X^1 and X^2 are as defined above for L4;

G^A is selected from the groups above.

R and R'

In one embodiment, R is independently selected from optionally substituted C_{1-12} alkyl, C_{3-20} heterocyclyl and C_{5-20} aryl groups. These groups are each defined in the substituents section below.

In one embodiment, R is independently optionally substituted C_{1-12} alkyl.

In one embodiment, R is independently optionally substituted C_{3-20} heterocyclyl.

In one embodiment, R is independently optionally substituted C_{5-20} aryl.

In one embodiment, R is independently optionally substituted C_{1-12} alkyl.

The preferences for R apply also to R'.

In some embodiments of the invention there is provided a compound having a substituent group -NRR'. In one embodiment, R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring. The ring may contain a further heteroatom, for example N, O or S.

In one embodiment, the heterocyclic ring is itself substituted with a group R. Where a further N heteroatom is present, the substituent may be on the N heteroatom.

R^{A4}

In one embodiment, R^{A4} is a C_{2-4} alkylene group.

In one embodiment, R^{A4} is a C_2 alkylene group.

In one embodiment, R^{A4} is a C_3 alkylene group.

In one embodiment, R^{A4} is an unsubstituted C_{1-6} alkylene group.

In one embodiment, R^{A4} is a linear C_{1-6} alkylene group.

In one embodiment, R^{A4} is selected from the group consisting of -CH₂CH₂-, -CH₂CH₂CH₂- and -CH₂CH₂CH₂CH₂-

Cell Binding Agent

A cell binding agent may be of any kind, and include peptides and non-peptides. These can include antibodies or a fragment of an antibody that contains at least one binding site, lymphokines, hormones, growth factors, nutrient-transport molecules, or any other cell binding molecule or substance.

The term "antibody" herein is used in the broadest sense and specifically covers monoclonal antibodies, polyclonal antibodies, dimers, multimers, multispecific antibodies (e.g., bispecific antibodies), and antibody fragments, so long as they exhibit the desired biological activity (Miller *et al* (2003) *Jour. of Immunology* 170:4854-4861). Antibodies may be murine, human, humanized, chimeric, or derived from other species. An antibody is a protein generated by the immune system that is capable of recognizing and binding to a specific antigen.

(Janeway, C., Travers, P., Walport, M., Shlomchik (2001) *Immuno Biology, 5th Ed.*, Garland Publishing, New York). A target antigen generally has numerous binding sites, also called epitopes, recognized by CDRs on multiple antibodies. Each antibody that specifically binds to a different epitope has a different structure. Thus, one antigen may have more than one corresponding antibody. An antibody includes a full-length immunoglobulin molecule or an immunologically active portion of a full-length immunoglobulin molecule, *i.e.*, a molecule that contains an antigen binding site that immunospecifically binds an antigen of a target of interest or part thereof, such targets including but not limited to, cancer cell or cells that produce autoimmune antibodies associated with an autoimmune disease. The immunoglobulin can be of any type (e.g. IgG, IgE, IgM, IgD, and IgA), class (e.g. IgG1, IgG2, IgG3, IgG4, IgA1 and IgA2) or subclass of immunoglobulin molecule. The immunoglobulins can be derived from any species, including human, murine, or rabbit origin.

"Antibody fragments" comprise a portion of a full length antibody, generally the antigen binding or variable region thereof. Examples of antibody fragments include Fab, Fab', F(ab')₂, and Fv fragments; diabodies; linear antibodies; fragments produced by a Fab expression library, anti-idiotypic (anti-Id) antibodies, CDR (complementary determining region), and epitope-binding fragments of any of the above which immunospecifically bind to cancer cell antigens, viral antigens or microbial antigens, single-chain antibody molecules; and multispecific antibodies formed from antibody fragments.

The term "monoclonal antibody" as used herein refers to an antibody obtained from a population of substantially homogeneous antibodies, i.e. the individual antibodies comprising the population are identical except for possible naturally occurring mutations that may be present in minor amounts. Monoclonal antibodies are highly specific, being directed against a single antigenic site. Furthermore, in contrast to polyclonal antibody preparations which include different antibodies directed against different determinants (epitopes), each monoclonal antibody is directed against a single determinant on the antigen. In addition to their specificity, the monoclonal antibodies are advantageous in that they may be synthesized uncontaminated by other antibodies. The modifier "monoclonal" indicates the character of the antibody as being obtained from a substantially homogeneous population of antibodies, and is not to be construed as requiring production of the antibody by any particular method. For example, the monoclonal antibodies to be used in accordance with the present invention may be made by the hybridoma method first described by Kohler *et al* (1975) *Nature* 256:495, or may be made by recombinant DNA methods (see, US 4816567). The monoclonal antibodies may also be isolated from phage antibody libraries using the techniques described in Clackson *et al* (1991) *Nature*, 352:624-628; Marks *et al* (1991) *J. Mol. Biol.*, 222:581-597.

The monoclonal antibodies herein specifically include "chimeric" antibodies in which a portion of the heavy and/or light chain is identical with or homologous to corresponding sequences in antibodies derived from a particular species or belonging to a particular antibody class or subclass, while the remainder of the chain(s) is identical with or homologous to corresponding sequences in antibodies derived from another species or belonging to another antibody class or subclass, as well as fragments of such antibodies, so long as they exhibit the desired biological activity (US 4816567; and Morrison *et al* (1984) *Proc. Natl. Acad. Sci. USA*, 81:6851-6855). Chimeric antibodies include "primatized" antibodies comprising variable domain antigen-binding sequences derived from a non-human primate (e.g. Old World Monkey or Ape) and human constant region sequences.

An "intact antibody" herein is one comprising a VL and VH domains, as well as a light chain constant domain (CL) and heavy chain constant domains, CH1, CH2 and CH3. The constant domains may be native sequence constant domains (e.g. human native sequence constant domains) or amino acid sequence variant thereof. The intact antibody may have one or more "effector functions" which refer to those biological activities attributable to the Fc region (a native sequence Fc region or amino acid sequence variant Fc region) of an antibody. Examples of antibody effector functions include C1q binding; complement

dependent cytotoxicity; Fc receptor binding; antibody-dependent cell-mediated cytotoxicity (ADCC); phagocytosis; and down regulation of cell surface receptors such as B cell receptor and BCR.

Depending on the amino acid sequence of the constant domain of their heavy chains, intact antibodies can be assigned to different "classes." There are five major classes of intact antibodies: IgA, IgD, IgE, IgG, and IgM, and several of these may be further divided into "subclasses" (isotypes), e.g., IgG1, IgG2, IgG3, IgG4, IgA, and IgA2. The heavy-chain constant domains that correspond to the different classes of antibodies are called α , δ , ϵ , γ , and μ , respectively. The subunit structures and three-dimensional configurations of different classes of immunoglobulins are well known.

Examples of cell binding agents include those agents described for use in WO 2007/085930, which is incorporated herein.

The cell binding agent may be, or comprise, a polypeptide. The polypeptide may be a cyclic polypeptide. The cell binding agent may be antibody. Thus, in one embodiment, the present invention provides an antibody-drug conjugate (ADC).

Drug loading

The drug loading is the average number of PBD drugs per antibody. Drug loading may range from 1 to 8 drugs (D) per antibody (Ab), i.e. where 1, 2, 3, 4, 5, 6, 7, and 8 drug moieties are covalently attached to the antibody. Compositions of ADC include collections of antibodies conjugated with a range of drugs, from 1 to 8. The average number of drugs per antibody in preparations of ADC from conjugation reactions may be characterized by conventional means such as mass spectroscopy, ELISA assay, electrophoresis, and HPLC. The quantitative distribution of ADC in terms of p may also be determined. By ELISA, the averaged value of p in a particular preparation of ADC may be determined (Hamblett et al (2004) Clin. Cancer Res. 10:7063-7070; Sanderson et al (2005) Clin. Cancer Res. 11:843-852). However, the distribution of p (drug) values is not discernible by the antibody-antigen binding and detection limitation of ELISA. Also, ELISA assay for detection of antibody-drug conjugates does not determine where the drug moieties are attached to the antibody, such as the heavy chain or light chain fragments, or the particular amino acid residues. In some instances, separation, purification, and characterization of homogeneous ADC where p is a certain value from ADC with other drug loadings may be achieved by means such as reverse phase HPLC or electrophoresis.

For some antibody-drug conjugates, p may be limited by the number of attachment sites on the antibody. For example, an antibody may have only one or several cysteine thiol groups, or may have only one or several sufficiently reactive thiol groups through which a linker may be attached. Higher drug loading, e.g. $p > 5$, may cause aggregation, insolubility, toxicity, or loss of cellular permeability of certain antibody-drug conjugates.

Typically, fewer than the theoretical maximum of drug moieties are conjugated to an antibody during a conjugation reaction. An antibody may contain, for example, many lysine residues that do not react with the drug-linker intermediate (D-L) or linker reagent. Only the most reactive lysine groups may react with an amine-reactive linker reagent. Also, only the most reactive cysteine thiol groups may react with a thiol-reactive linker reagent. Generally, antibodies do not contain many, if any, free and reactive cysteine thiol groups which may be linked to a drug moiety. Most cysteine thiol residues in the antibodies of the compounds exist as disulfide bridges and must be reduced with a reducing agent such as dithiothreitol (DTT) or TCEP, under partial or total reducing conditions. The loading (drug/antibody ratio) of an ADC may be controlled in several different manners, including: (i) limiting the molar excess of drug-linker intermediate (D-L) or linker reagent relative to antibody, (ii) limiting the conjugation reaction time or temperature, and (iii) partial or limiting reductive conditions for cysteine thiol modification.

Cysteine amino acids may be engineered at reactive sites in an antibody and which do not form intrachain or intermolecular disulfide linkages (Junutula, et al., 2008b *Nature Biotech.*, 26(8):925-932; Dorman et al (2009) *Blood* 114(13):2721-2729; US 7521541; US 7723485; WO2009/052249, Shen et al (2012) *Nature Biotech.*, 30(2):184-191; Junutula et al (2008) *Jour of Immun. Methods* 332:41-52). The engineered cysteine thiols may react with linker reagents or the drug-linker reagents of the present invention which have thiol-reactive, electrophilic groups such as maleimide or alpha-halo amides to form ADC with cysteine engineered antibodies (ThioMabs) and the PBD drug moieties. The location of the drug moiety can thus be designed, controlled, and known. The drug loading can be controlled since the engineered cysteine thiol groups typically react with thiol-reactive linker reagents or drug-linker reagents in high yield. Engineering an IgG antibody to introduce a cysteine amino acid by substitution at a single site on the heavy or light chain gives two new cysteines on the symmetrical antibody. A drug loading near 2 can be achieved and near homogeneity of the conjugation product ADC.

Where more than one nucleophilic or electrophilic group of the antibody reacts with a drug-linker intermediate, or linker reagent followed by drug moiety reagent, then the resulting product is a mixture of ADC compounds with a distribution of drug moieties attached to an antibody, e.g. 1, 2, 3, etc. Liquid chromatography methods such as polymeric reverse phase (PLRP) and hydrophobic interaction (HIC) may separate compounds in the mixture by drug loading value. Preparations of ADC with a single drug loading value (p) may be isolated, however, these single loading value ADCs may still be heterogeneous mixtures because the drug moieties may be attached, via the linker, at different sites on the antibody.

Thus the antibody-drug conjugate compositions of the invention include mixtures of antibody-drug conjugate compounds where the antibody has one or more PBD drug moieties and where the drug moieties may be attached to the antibody at various amino acid residues.

In one embodiment, the average number of dimer pyrrolobenzodiazepine groups per cell binding agent is in the range 1 to 20. In some embodiments the range is selected from 1 to 8, 2 to 8, 2 to 6, 2 to 4, and 4 to 8.

In some embodiments, there is one dimer pyrrolobenzodiazepine groups per cell binding agent.

Peptides

In one embodiment, the cell binding agent is a linear or cyclic peptide comprising 4-20, preferably 6-20, contiguous amino acid residues. In this embodiment, it is preferred that one cell binding agent is linked to one monomer or dimer pyrrolobenzodiazepine compound.

In one embodiment the cell binding agent comprises a peptide that binds integrin $\alpha_v\beta_6$. The peptide may be selective for $\alpha_v\beta_6$ over XYS .

In one embodiment the cell binding agent comprises the A20FMDV-Cys polypeptide. The A20FMDV-Cys has the sequence: NAVPNLRGDLQVLAQKVARTC. Alternatively, a variant of the A20FMDV-Cys sequence may be used wherein one, two, three, four, five, six, seven, eight, nine or ten amino acid residues is substituted with another amino acid residue.

In one embodiment the antibody is a monoclonal antibody; chimeric antibody; humanized antibody; fully human antibody; or a single chain antibody. One embodiment the antibody is

a fragment of one of these antibodies having biological activity. Examples of such fragments include Fab, Fab', F(ab')₂ and Fv fragments.

In these embodiments, each antibody may be linked to one or several dimer pyrrolobenzodiazepine groups. The preferred ratios of pyrrolobenzodiazepine to cell binding agent are given above.

The antibody may be a domain antibody (DAB).

In one embodiment, the antibody is a monoclonal antibody.

Antibodies for use in the present invention include those antibodies described in WO 2005/082023 which is incorporated herein. Particularly preferred are those antibodies for tumour-associated antigens. Examples of those antigens known in the art include, but are not limited to, those tumour-associated antigens set out in WO 2005/082023. See, for instance, pages 41-55.

The conjugates of the invention are designed to target tumour cells via their cell surface antigens. The antigens are usually normal cell surface antigens which are either over-expressed or expressed at abnormal times. Ideally the target antigen is expressed only on proliferative cells (preferably tumour cells), however this is rarely observed in practice. As a result, target antigens are usually selected on the basis of differential expression between proliferative and healthy tissue.

Tumor-associated antigens (TAA) are known in the art, and can prepared for use in generating antibodies using methods and information which are well known in the art. In attempts to discover effective cellular targets for cancer diagnosis and therapy, researchers have sought to identify transmembrane or otherwise tumor-associated polypeptides that are specifically expressed on the surface of one or more particular type(s) of cancer cell as compared to on one or more normal non-cancerous cell(s). Often, such tumor-associated polypeptides are more abundantly expressed on the surface of the cancer cells as compared to on the surface of the non-cancerous cells. The identification of such tumor-associated cell surface antigen polypeptides has given rise to the ability to specifically target cancer cells for destruction via antibody-based therapies.

Examples of TAA include, but are not limited to, TAA (1)-(36) listed below. For convenience, information relating to these antigens, all of which are known in the art, is listed below and includes names, alternative names, Genbank accession numbers and primary reference(s), following nucleic acid and protein sequence identification conventions of the National Center for Biotechnology Information (NCBI). Nucleic acid and protein sequences corresponding to TAA (1)-(36) are available in public databases such as GenBank. Tumor-associated antigens targeted by antibodies include all amino acid sequence variants and isoforms possessing at least about 70%, 80%, 85%, 90%, or 95% sequence identity relative to the sequences identified in the cited references, or which exhibit substantially the same biological properties or characteristics as a TAA having a sequence found in the cited references. For example, a TAA having a variant sequence generally is able to bind specifically to an antibody that binds specifically to the TAA with the corresponding sequence listed. The sequences and disclosure in the reference specifically recited herein are expressly incorporated by reference.

(Example 3; Fig 4); Accession: P04626; EMBL; M11767; AAA35808.1. EMBL; M11761; AAA35808.1. In certain embodiments, conjugate compounds of the invention comprise anti-HER2 antibodies. In one embodiment of the invention, an anti-HER2 antibody of an ADC of the invention comprises a humanized anti-HER2 antibody, e.g., huMAb4D5-1, huMAb4D5-2, huMAb4D5-3, huMAb4D5-4, huMAb4D5-5, huMAb4D5-6, huMAb4D5-7 and huMAb4D5-8, as described in Table 3 of US 5821337. Those antibodies contain human framework regions with the complementarity-determining regions of a murine antibody (4D5) that binds to HER2. The humanized antibody huMAb4D5-8 is also referred to as trastuzumab, commercially available under the tradename HERCEPTIN. In another embodiment of the invention, an anti-HER2 antibody of an ADC of the invention comprises a humanized anti-HER2 antibody, e.g., humanized 2C4, as described in US7862817. An exemplary humanized 2C4 antibody is pertuzumab, commercially available under the tradename PERJETA.

(38) LGR5/GPR49; Nucleotide: Genbank accession no. NM_003667; Genbank version no. NM_003667.2 GI:24475886; Genbank record update date: Jul 22, 2012 03:38 PM; Polypeptide: Genbank accession no. NP_003658; Genbank version no. NP_003658.1 GI:4504379; Genbank record update date: Jul 22, 2012 03:38 PM.

In some embodiments, the anti-LGR5 antibody comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 46; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 47; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 48; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 43; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 44; and (f) HVR-L3 comprising the amino acid sequence of SEQ ID NO: 45.

In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO: 40 and SEQ ID NO: 39, respectively, including post-translational modifications of those sequences.

In some embodiments, the anti-LGR5 comprises (a) HVR-H1 comprising the amino acid sequence of SEQ ID NO: 52; (b) HVR-H2 comprising the amino acid sequence of SEQ ID NO: 53; (c) HVR-H3 comprising the amino acid sequence of SEQ ID NO: 54; (d) HVR-L1 comprising the amino acid sequence of SEQ ID NO: 49; (e) HVR-L2 comprising the amino acid sequence of SEQ ID NO: 50; and (f) HVR-L3 comprising an amino acid sequence selected from SEQ ID NO: 51.

In some embodiments, the anti-LgR5 antibody comprises a VH as in any of the embodiments provided above, and a VL as in any of the embodiments provided above. In one embodiment, the antibody comprises the VH and VL sequences in SEQ ID NO:42 and SEQ ID NO:41, respectively, including post-translational modifications of those sequences.

The parent antibody may also be a fusion protein comprising an albumin-binding peptide (ABP) sequence (Dennis *et al.* (2002) "Albumin Binding As A General Strategy For Improving The Pharmacokinetics Of Proteins" *J Biol Chem.* 277:35035-35043; WO 01/45746). Antibodies of the invention include fusion proteins with ABP sequences taught by: (i) Dennis *et al* (2002) *J Biol Chem.* 277:35035-35043 at Tables III and IV, page 35038; (ii) US 2004/0001827 at [0076]; and (iii) WO 01/45746 at pages 12-13, and all of which are incorporated herein by reference.

In one embodiment, the antibody has been raised to target specific the tumour related antigen $\alpha_v\beta_6$.

The cell binding agent may be labelled, for example to aid detection or purification of the agent either prior to incorporation as a conjugate, or as part of the conjugate. The label may be a biotin label. In another embodiment, the cell binding agent may be labelled with a radioisotope.

Substituents

The phrase "optionally substituted" as used herein, pertains to a parent group which may be unsubstituted or which may be substituted.

Unless otherwise specified, the term "substituted" as used herein, pertains to a parent group which bears one or more substituents. The term "substituent" is used herein in the conventional sense and refers to a chemical moiety which is covalently attached to, or if appropriate, fused to, a parent group. A wide variety of substituents are well known, and methods for their formation and introduction into a variety of parent groups are also well known.

In a preferred embodiment, the substituents described herein (which include optional substituents) are limited to those groups that are not reactive to a cell binding agent. The link to the cell binding agent in the present case is formed from the bridge between the two PBD moieties through a linker group to the cell binding agent. Reactive functional groups located at other parts of the PBD structure may be capable of forming additional bonds to the cell binding agent (this may be referred to as crosslinking). These additional bonds may alter transport and biological activity of the conjugate. Therefore, in some embodiment, the additional substituents are limited to those lacking reactive functionality.

In one embodiment, the substituents are selected from the group consisting of R, OR, SR, NRR', NO₂, halo, CO₂R, COR, CONH₂, CONHR, and CONRR'.

In one embodiment, the substituents are selected from the group consisting of R, OR, SR, NRR', NO₂, CO₂R, COR, CONH₂, CONHR, and CONRR'.

In one embodiment, the substituents are selected from the group consisting of R, OR, SR, NRR', NO₂, and halo.

In one embodiment, the substituents are selected from the group consisting of R, OR, SR, NRR', and NO₂.

Any one of the embodiment mentioned above may be applied to any one of the substituents described herein. Alternatively, the substituents may be selected from one or more of the groups listed below.

Examples of substituents are described in more detail below.

C₁₋₁₂ alkyl: The term "C₁₋₁₂ alkyl" as used herein, pertains to a monovalent moiety obtained by removing a hydrogen atom from a carbon atom of a hydrocarbon compound having from 1 to 12 carbon atoms, which may be aliphatic or alicyclic, and which may be saturated or unsaturated (e.g. partially unsaturated, fully unsaturated). Thus, the term "alkyl" includes the sub-classes alkenyl, alkynyl, cycloalkyl, etc., discussed below.

Examples of saturated alkyl groups include, but are not limited to, methyl (C₁), ethyl (C₂), propyl (C₃), butyl (C₄), pentyl (C₅), hexyl (C₆) and heptyl (C₇).

Examples of saturated linear alkyl groups include, but are not limited to, methyl (C₁), ethyl (C₂), n-propyl (C₃), n-butyl (C₄), n-pentyl (amyl) (C₅), n-hexyl (C₆) and n-heptyl (C₇).

Examples of saturated branched alkyl groups include iso-propyl (C₃), iso-butyl (C₄), sec-butyl (C₄), tert-butyl (C₄), iso-pentyl (C₅), and neo-pentyl (C₅).

An alkyl group may optionally be interrupted by one or more heteroatoms selected from O, N(H) and S. Such groups may be referred to as "heteroalkyl".

C₂₋₁₂ Heteroalkyl: The term "C₂₋₁₂ heteroalkyl" as used herein, pertains to a monovalent moiety obtained by removing a hydrogen atom from a carbon atom of a hydrocarbon compound having from 2 to 12 carbon atoms, and one or more heteroatoms selected from O, N(H) and S, preferably O and S.

Examples of heteroalkyl groups include, but are not limited to those comprising one or more ethylene glycol units of the type -(OCH₂CH₂)-. The terminal of a heteroalkyl group may be the primary form of a heteroatom, e.g. -OH, -SH or -NH₂. In a preferred embodiment, the terminal is -CH₃.

C₂₋₁₂ Alkenyl: The term "C₂₋₁₂ alkenyl" as used herein, pertains to an alkyl group having one or more carbon-carbon double bonds.

Examples of unsaturated alkenyl groups include, but are not limited to, ethenyl (vinyl, $-\text{CH}=\text{CH}_2$), 1-propenyl ($-\text{CH}=\text{CH}-\text{CH}_3$), 2-propenyl (allyl, $-\text{CH}-\text{CH}=\text{CH}_2$), isopropenyl (1-methylvinyl, $-\text{C}(\text{CH}_3)=\text{CH}_2$), butenyl (C_4), pentenyl (C_5), and hexenyl (C_6).

C_{2-12} alkynyl: The term " C_{2-12} alkynyl" as used herein, pertains to an alkyl group having one or more carbon-carbon triple bonds.

Examples of unsaturated alkynyl groups include, but are not limited to, ethynyl ($-\text{C}\equiv\text{CH}$) and 2-propynyl (propargyl, $-\text{CH}_2-\text{C}\equiv\text{CH}$).

C_{3-12} cycloalkyl: The term " C_{3-12} cycloalkyl" as used herein, pertains to an alkyl group which is also a cyclyl group; that is, a monovalent moiety obtained by removing a hydrogen atom from an alicyclic ring atom of a cyclic hydrocarbon (carbocyclic) compound, which moiety has from 3 to 7 carbon atoms, including from 3 to 7 ring atoms.

Examples of cycloalkyl groups include, but are not limited to, those derived from:

saturated monocyclic hydrocarbon compounds:

cyclopropane (C_3), cyclobutane (C_4), cyclopentane (C_5), cyclohexane (C_6), cycloheptane (C_7), methylcyclopropane (C_4), dimethylcyclopropane (C_5), methylcyclobutane (C_5), dimethylcyclobutane (C_6), methylcyclopentane (C_6), dimethylcyclopentane (C_7) and methylcyclohexane (C_7);

unsaturated monocyclic hydrocarbon compounds:

cyclopropene (C_3), cyclobutene (C_4), cyclopentene (C_5), cyclohexene (C_6), methylcyclopropene (C_4), dimethylcyclopropene (C_5), methylcyclobutene (C_5), dimethylcyclobutene (C_6), methylcyclopentene (C_6), dimethylcyclopentene (C_7) and methylcyclohexene (C_7); and

saturated polycyclic hydrocarbon compounds:

norcarane (C_7), norpinane (C_7), norbornane (C_7).

C_{3-20} heterocyclyl: The term " C_{3-20} heterocyclyl" as used herein, pertains to a monovalent moiety obtained by removing a hydrogen atom from a ring atom of a heterocyclic compound, which moiety has from 3 to 20 ring atoms, of which from 1 to 10 are ring heteroatoms. Preferably, each ring has from 3 to 7 ring atoms, of which from 1 to 4 are ring heteroatoms.

In this context, the prefixes (e.g. C_{3-20} , C_{3-7} , C_{5-6} , etc.) denote the number of ring atoms, or range of number of ring atoms, whether carbon atoms or heteroatoms. For example, the

term "C₅₋₆heterocyclyl", as used herein, pertains to a heterocyclyl group having 5 or 6 ring atoms.

Examples of monocyclic heterocyclyl groups include, but are not limited to, those derived from:

N₁: aziridine (C₃), azetidene (C₄), pyrrolidine (tetrahydropyrrole) (C₅), pyrroline (e.g., 3-pyrroline, 2,5-dihydropyrrole) (C₅), 2H-pyrrole or 3H-pyrrole (isopyrrole, isoazole) (C₅), piperidine (C₆), dihydropyridine (C₆), tetrahydropyridine (C₆), azepine (C₇);

O₁: oxirane (C₃), oxetane (C₄), oxolane (tetrahydrofuran) (C₅), oxole (dihydrofuran) (C₅), oxane (tetrahydropyran) (C₆), dihydropyran (C₆), pyran (C₆), oxepin (C₇);

S₁: thiirane (C₃), thietane (C₄), thiolane (tetrahydrothiophene) (C₅), thiane (tetrahydrothiopyran) (C₆), thiepane (C₇);

O₂: dioxolane (C₅), dioxane (C₆), and dioxepane (C₇);

O₃: trioxane (C₆);

N₂: imidazolidine (C₅), pyrazolidine (diazolidine) (C₅), imidazoline (C₅), pyrazoline (dihydropyrazole) (C₅), piperazine (C₆);

N₁O₁: tetrahydrooxazole (C₅), dihydrooxazole (C₅), tetrahydroisoxazole (C₅), dihydroisoxazole (C₅), morpholine (C₆), tetrahydrooxazine (C₆), dihydrooxazine (C₆), oxazine (C₆);

N₁S₁: thiazoline (C₅), thiazolidine (C₅), thiomorpholine (C₆);

N₂O₁: oxadiazine (C₆);

O₁S₁: oxathiole (C₅) and oxathiane (thioxane) (C₆); and,

N₁O₁S₁: oxathiazine (C₆).

Examples of substituted monocyclic heterocyclyl groups include those derived from saccharides, in cyclic form, for example, furanoses (C₅), such as arabinofuranose, lyxofuranose, ribofuranose, and xylofuranose, and pyranoses (C₆), such as allopyranose, altropyranose, glucopyranose, mannopyranose, gulopyranose, idopyranose, galactopyranose, and talopyranose.

C₅₋₂₀ aryl: The term "C₅₋₂₀ aryl", as used herein, pertains to a monovalent moiety obtained by removing a hydrogen atom from an aromatic ring atom of an aromatic compound, which moiety has from 3 to 20 ring atoms. Preferably, each ring has from 5 to 7 ring atoms.

In this context, the prefixes (e.g. C₃₋₂₀, C₅₋₇, C₅₋₆, etc.) denote the number of ring atoms, or range of number of ring atoms, whether carbon atoms or heteroatoms. For example, the term "C₅₋₆ aryl" as used herein, pertains to an aryl group having 5 or 6 ring atoms.

The ring atoms may be all carbon atoms, as in "carboaryl groups".

Examples of carboaryl groups include, but are not limited to, those derived from benzene (i.e. phenyl) (C₆), naphthalene (C₁₀), azulene (C₁₀), anthracene (C₁₄), phenanthrene (C₁₄), naphthacene (C₁₈), and pyrene (C₁₆).

Examples of aryl groups which comprise fused rings, at least one of which is an aromatic ring, include, but are not limited to, groups derived from indane (e.g. 2,3-dihydro-1H-indene) (C₉), indene (C₉), isoindene (C₉), tetraline (1,2,3,4-tetrahydronaphthalene (C₁₀), acenaphthene (C₁₂), fluorene (C₁₃), phenalene (C₁₃), acephenanthrene (C₁₅), and aceanthrene (C₁₆).

Alternatively, the ring atoms may include one or more heteroatoms, as in "heteroaryl groups". Examples of monocyclic heteroaryl groups include, but are not limited to, those derived from:

N₁: pyrrole (azole) (C₅), pyridine (azine) (C₆);

O₁: furan (oxole) (C₅);

S₁: thiophene (thiole) (C₅);

N₁O₁: oxazole (C₅), isoxazole (C₅), isoxazine (C₆);

N₂O₁: oxadiazole (furazan) (C₅);

N₃O₁: oxatriazole (C₅);

N₁S₁: thiazole (C₅), isothiazole (C₅);

N₂: imidazole (1,3-diazole) (C₅), pyrazole (1,2-diazole) (C₅), pyridazine (1,2-diazine) (C₆), pyrimidine (1,3-diazine) (C₆) (e.g., cytosine, thymine, uracil), pyrazine (1,4-diazine) (C₆);

N₃: triazole (C₅), triazine (C₆); and,

N₄: tetrazole (C₅).

Examples of heteroaryl which comprise fused rings, include, but are not limited to:

C₉ (with 2 fused rings) derived from benzofuran (O₁), isobenzofuran (O₁), indole (N₁), isoindole (N₁), indolizine (N₁), indoline (N₁), isoindoline (N₁), purine (N₄) (e.g., adenine, guanine), benzimidazole (N₂), indazole (N₂), benzoxazole (N₁O₁), benzisoxazole (N₁O₁), benzodioxole (O₂), benzofurazan (N₂O₁), benzotriazole (N₃), benzothiofuran (S₁), benzothiazole (N₁S₁), benzothiadiaazole (N₂S);

C₁₀ (with 2 fused rings) derived from chromene (O₁), isochromene (O₁), chroman (O₁), isochroman (O₁), benzodioxan (O₂), quinoline (N₁), isoquinoline (N₁), quinolizine (N₁), benzoxazine (N₁O₁), benzodiazine (N₂), pyridopyridine (N₂), quinoxaline (N₂), quinazoline (N₂), cinnoline (N₂), phthalazine (N₂), naphthyridine (N₂), pteridine (N₄);

C₁₁ (with 2 fused rings) derived from benzodiazepine (N₂);

C₁₃ (with 3 fused rings) derived from carbazole (N₁), dibenzofuran (O₁), dibenzothiophene (S₁), carboline (N₂), perimidine (N₂), pyridoindole (N₂); and,

C₁₄ (with 3 fused rings) derived from acridine (N₁), xanthene (O₁), thioxanthene (S₁), oxanthrene (O₂), phenoxathiin (O₁S₁), phenazine (N₂), phenoxazine (N₁O₁), phenothiazine (N₁S₁), thianthrene (S₂), phenanthridine (N₁), phenanthroline (N₂), phenazine (N₂).

The above groups, whether alone or part of another substituent, may themselves optionally be substituted with one or more groups selected from themselves and the additional substituents listed below.

Halo: -F, -Cl, -Br, and -I.

Hydroxy: -OH.

Ether: -OR, wherein R is an ether substituent, for example, a C₁₋₇ alkyl group (also referred to as a C₁₋₇ alkoxy group, discussed below), a C₃₋₂₀ heterocyclyl group (also referred to as a C₃₋₂₀ heterocyclyloxy group), or a C₅₋₂₀ aryl group (also referred to as a C₅₋₂₀ aryloxy group), preferably a C₁₋₇alkyl group.

Alkoxy: -OR, wherein R is an alkyl group, for example, a C₁₋₇ alkyl group. Examples of C₁₋₇ alkoxy groups include, but are not limited to, -OMe (methoxy), -OEt (ethoxy), -O(nPr) (n-propoxy), -O(iPr) (isopropoxy), -O(nBu) (n-butoxy), -O(sBu) (sec-butoxy), -O(iBu) (isobutoxy), and -O(tBu) (tert-butoxy).

Acetal: -CH(OR¹)(OR²), wherein R¹ and R² are independently acetal substituents, for example, a C₁₋₇ alkyl group, a C₃₋₂₀ heterocyclyl group, or a C₅₋₂₀ aryl group, preferably a C₁₋₇ alkyl group, or, in the case of a "cyclic" acetal group, R¹ and R², taken together with the two oxygen atoms to which they are attached, and the carbon atoms to which they are attached, form a heterocyclic ring having from 4 to 8 ring atoms. Examples of acetal groups include, but are not limited to, -CH(OMe)₂, -CH(OEt)₂, and -CH(OMe)(OEt).

Hemiacetal: $-\text{CH}(\text{OH})(\text{OR}^1)$, wherein R^1 is a hemiacetal substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of hemiacetal groups include, but are not limited to, $-\text{CH}(\text{OH})(\text{OMe})$ and $-\text{CH}(\text{OH})(\text{OEt})$.

Ketal: $-\text{CR}(\text{OR}^1)(\text{OR}^2)$, where R^1 and R^2 are as defined for acetals, and R is a ketal substituent other than hydrogen, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples ketal groups include, but are not limited to, $-\text{C}(\text{Me})(\text{OMe})_2$, $-\text{C}(\text{Me})(\text{OEt})_2$, $-\text{C}(\text{Me})(\text{OMe})(\text{OEt})$, $-\text{C}(\text{Et})(\text{OMe})_2$, $-\text{C}(\text{Et})(\text{OEt})_2$, and $-\text{C}(\text{Et})(\text{OMe})(\text{OEt})$.

Hemiketal: $-\text{CR}(\text{OH})(\text{OR}^1)$, where R^1 is as defined for hemiacetals, and R is a hemiketal substituent other than hydrogen, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of hemiacetal groups include, but are not limited to, $-\text{C}(\text{Me})(\text{OH})(\text{OMe})$, $-\text{C}(\text{Et})(\text{OH})(\text{OMe})$, $-\text{C}(\text{Me})(\text{OH})(\text{OEt})$, and $-\text{C}(\text{Et})(\text{OH})(\text{OEt})$.

Oxo (keto, -one): $=\text{O}$.

Thione (thioketone): $=\text{S}$.

Imino (imine): $=\text{NR}$, wherein R is an imino substituent, for example, hydrogen, C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably hydrogen or a C_{1-7} alkyl group. Examples of ester groups include, but are not limited to, $=\text{NH}$, $=\text{NMe}$, $=\text{NEt}$, and $=\text{NPh}$.

Formyl (carbaldehyde, carboxaldehyde): $-\text{C}(=\text{O})\text{H}$.

Acyl (keto): $-\text{C}(=\text{O})\text{R}$, wherein R is an acyl substituent, for example, a C_{1-7} alkyl group (also referred to as C_{1-7} alkylacyl or C_{1-7} alkanoyl), a C_{3-20} heterocyclyl group (also referred to as C_{3-20} heterocyclylacyl), or a C_{5-20} aryl group (also referred to as C_{5-20} arylacyl), preferably a C_{1-7} alkyl group. Examples of acyl groups include, but are not limited to, $-\text{C}(=\text{O})\text{CH}_3$ (acetyl), $-\text{C}(=\text{O})\text{CH}_2\text{CH}_3$ (propionyl), $-\text{C}(=\text{O})\text{C}(\text{CH}_3)_3$ (t-butyryl), and $-\text{C}(=\text{O})\text{Ph}$ (benzoyl, phenone).

Carboxy (carboxylic acid): $-\text{C}(=\text{O})\text{OH}$.

Thiocarboxy (thiocarboxylic acid): $-\text{C}(=\text{S})\text{SH}$.

Thiolocarboxy (thiolocarboxylic acid): $-\text{C}(=\text{O})\text{SH}$.

Thionocarboxy (thionocarboxylic acid): $-\text{C}(=\text{S})\text{OH}$.

Imidic acid: $-\text{C}(=\text{NH})\text{OH}$.

Hydroxamic acid: $-\text{C}(=\text{NOH})\text{OH}$.

Ester (carboxylate, carboxylic acid ester, oxycarbonyl): $-\text{C}(=\text{O})\text{OR}$, wherein R is an ester substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of ester groups include, but are not limited to, $-\text{C}(=\text{O})\text{OCH}_3$, $-\text{C}(=\text{O})\text{OCH}_2\text{CH}_3$, $-\text{C}(=\text{O})\text{OC}(\text{CH}_3)_3$, and $-\text{C}(=\text{O})\text{OPh}$.

Acyloxy (reverse ester): $-\text{OC}(=\text{O})\text{R}$, wherein R is an acyloxy substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of acyloxy groups include, but are not limited to, $-\text{OC}(=\text{O})\text{CH}_3$ (acetoxo), $-\text{OC}(=\text{O})\text{CH}_2\text{CH}_3$, $-\text{OC}(=\text{O})\text{C}(\text{CH}_3)_3$, $-\text{OC}(=\text{O})\text{Ph}$, and $-\text{OC}(=\text{O})\text{CH}_2\text{Ph}$.

Oxycarboxyloxy: $-\text{OC}(=\text{O})\text{OR}$, wherein R is an ester substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of ester groups include, but are not limited to, $-\text{OC}(=\text{O})\text{OCH}_3$, $-\text{OC}(=\text{O})\text{OCH}_2\text{CH}_3$, $-\text{OC}(=\text{O})\text{OC}(\text{CH}_3)_3$, and $-\text{OC}(=\text{O})\text{OPh}$.

Amino: $-\text{NR}^1\text{R}^2$, wherein R^1 and R^2 are independently amino substituents, for example, hydrogen, a C_{1-7} alkyl group (also referred to as C_{1-7} alkylamino or di- C_{1-7} alkylamino), a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably H or a C_{1-7} alkyl group, or, in the case of a "cyclic" amino group, R^1 and R^2 , taken together with the nitrogen atom to which they are attached, form a heterocyclic ring having from 4 to 8 ring atoms. Amino groups may be primary ($-\text{NH}_2$), secondary ($-\text{NHR}^1$), or tertiary ($-\text{NHR}^1\text{R}^2$), and in cationic form, may be quaternary ($-\text{N}^+\text{R}^1\text{R}^2\text{R}^3$). Examples of amino groups include, but are not limited to, $-\text{NH}_2$, $-\text{NHCH}_3$, $-\text{NHC}(\text{CH}_3)_2$, $-\text{N}(\text{CH}_3)_2$, $-\text{N}(\text{CH}_2\text{CH}_3)_2$, and $-\text{NHPh}$. Examples of cyclic amino groups include, but are not limited to, aziridino, azetidino, pyrrolidino, piperidino, piperazino, morpholino, and thiomorpholino.

Amido (carbamoyl, carbamyl, aminocarbonyl, carboxamide): $-C(=O)NR^1R^2$, wherein R^1 and R^2 are independently amino substituents, as defined for amino groups. Examples of amido groups include, but are not limited to, $-C(=O)NH_2$, $-C(=O)NHCH_3$, $-C(=O)N(CH_3)_2$, $-C(=O)NHCH_2CH_3$, and $-C(=O)N(CH_2CH_3)_2$, as well as amido groups in which R^1 and R^2 , together with the nitrogen atom to which they are attached, form a heterocyclic structure as in, for example, piperidinocarbonyl, morpholinocarbonyl, thiomorpholinocarbonyl, and piperazinocarbonyl.

Thioamido (thiocarbamyl): $-C(=S)NR^1R^2$, wherein R^1 and R^2 are independently amino substituents, as defined for amino groups. Examples of amido groups include, but are not limited to, $-C(=S)NH_2$, $-C(=S)NHCH_3$, $-C(=S)N(CH_3)_2$, and $-C(=S)NHCH_2CH_3$.

Acylamido (acylamino): $-NR^1C(=O)R^2$, wherein R^1 is an amide substituent, for example, hydrogen, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably hydrogen or a C_{1-7} alkyl group, and R^2 is an acyl substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably hydrogen or a C_{1-7} alkyl group. Examples of acylamide groups include, but are not limited to, $-NHC(=O)CH_3$, $-NHC(=O)CH_2CH_3$, and $-NHC(=O)Ph$. R^1 and R^2 may together form a cyclic structure, as in, for example, succinimidyl, maleimidyl, and phthalimidyl:

Aminocarbonyloxy: $-OC(=O)NR^1R^2$, wherein R^1 and R^2 are independently amino substituents, as defined for amino groups. Examples of aminocarbonyloxy groups include, but are not limited to, $-OC(=O)NH_2$, $-OC(=O)NHMe$, $-OC(=O)NMe_2$, and $-OC(=O)NEt_2$.

Ureido: $-N(R^1)CONR^2R^3$ wherein R^2 and R^3 are independently amino substituents, as defined for amino groups, and R^1 is a ureido substituent, for example, hydrogen, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably hydrogen or a C_{1-7} alkyl group. Examples of ureido groups include, but are not limited to, $-NHCONH_2$, $-NHCONHMe$, $-NHCONHEt$, $-NHCONMe_2$, $-NHCONEt_2$, $-NMeCONH_2$, $-NMeCONHMe$, $-NMeCONHEt$, $-NMeCONMe_2$, and $-NMeCONEt_2$.

Guanidino: $-\text{NH}-\text{C}(=\text{NH})\text{NH}_2$.

Tetrazolyl: a five membered aromatic ring having four nitrogen atoms and one carbon atom,

Imino: $=\text{NR}$, wherein R is an imino substituent, for example, for example, hydrogen, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably H or a C_{1-7} alkyl group. Examples of imino groups include, but are not limited to, $=\text{NH}$, $=\text{NMe}$, and $=\text{NEt}$.

Amidine (amidino): $-\text{C}(=\text{NR})\text{NR}_2$, wherein each R is an amidine substituent, for example, hydrogen, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably H or a C_{1-7} alkyl group. Examples of amidine groups include, but are not limited to, $-\text{C}(=\text{NH})\text{NH}_2$, $-\text{C}(=\text{NH})\text{NMe}_2$, and $-\text{C}(=\text{NMe})\text{NMe}_2$.

Nitro: $-\text{NO}_2$.

Nitroso: $-\text{NO}$.

Azido: $-\text{N}_3$.

Cyano (nitrile, carbonitrile): $-\text{CN}$.

Isocyano: $-\text{NC}$.

Cyanato: $-\text{OCN}$.

Isocyanato: $-\text{NCO}$.

Thiocyano (thiocyanato): $-\text{SCN}$.

Isothiocyano (isothiocyanato): $-\text{NCS}$.

Sulfhydryl (thiol, mercapto): $-\text{SH}$.

Thioether (sulfide): $-SR$, wherein R is a thioether substituent, for example, a C_{1-7} alkyl group (also referred to as a C_{1-7} alkylthio group), a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of C_{1-7} alkylthio groups include, but are not limited to, $-SCH_3$ and $-SCH_2CH_3$.

Disulfide: $-SS-R$, wherein R is a disulfide substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group (also referred to herein as C_{1-7} alkyl disulfide). Examples of C_{1-7} alkyl disulfide groups include, but are not limited to, $-SSCH_3$ and $-SSCH_2CH_3$.

Sulfine (sulfinyl, sulfoxide): $-S(=O)R$, wherein R is a sulfine substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfine groups include, but are not limited to, $-S(=O)CH_3$ and $-S(=O)CH_2CH_3$.

Sulfone (sulfonyl): $-S(=O)_2R$, wherein R is a sulfone substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group, including, for example, a fluorinated or perfluorinated C_{1-7} alkyl group. Examples of sulfone groups include, but are not limited to, $-S(=O)_2CH_3$ (methanesulfonyl, mesyl), $-S(=O)_2CF_3$ (triflyl), $-S(=O)_2CH_2CH_3$ (esyl), $-S(=O)_2C_4F_9$ (nonaflyl), $-S(=O)_2CH_2CF_3$ (tresyl), $-S(=O)_2CH_2CH_2NH_2$ (tauryl), $-S(=O)_2Ph$ (phenylsulfonyl, besyl), 4-methylphenylsulfonyl (tosyl), 4-chlorophenylsulfonyl (closyl), 4-bromophenylsulfonyl (brosyl), 4-nitrophenyl (nosyl), 2-naphthalenesulfonate (napsyl), and 5-dimethylamino-naphthalen-1-ylsulfonate (dansyl).

Sulfinic acid (sulfino): $-S(=O)OH$, $-SO_2H$.

Sulfonic acid (sulfo): $-S(=O)_2OH$, $-SO_3H$.

Sulfinate (sulfinic acid ester): $-S(=O)OR$; wherein R is a sulfinate substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfinate groups include, but are not limited to, $-S(=O)OCH_3$ (methoxysulfinyl; methyl sulfinate) and $-S(=O)OCH_2CH_3$ (ethoxysulfinyl; ethyl sulfinate).

Sulfonate (sulfonic acid ester): $-S(=O)_2OR$, wherein R is a sulfonate substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfonate groups include, but are not limited to, $-S(=O)_2OCH_3$ (methoxysulfonyl; methyl sulfonate) and $-S(=O)_2OCH_2CH_3$ (ethoxysulfonyl; ethyl sulfonate).

Sulfinyloxy: $-\text{OS}(=\text{O})\text{R}$, wherein R is a sulfinyloxy substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfinyloxy groups include, but are not limited to, $-\text{OS}(=\text{O})\text{CH}_3$ and $-\text{OS}(=\text{O})\text{CH}_2\text{CH}_3$.

Sulfonyloxy: $-\text{OS}(=\text{O})_2\text{R}$, wherein R is a sulfonyloxy substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfonyloxy groups include, but are not limited to, $-\text{OS}(=\text{O})_2\text{CH}_3$ (mesylate) and $-\text{OS}(=\text{O})_2\text{CH}_2\text{CH}_3$ (esylate).

Sulfate: $-\text{OS}(=\text{O})_2\text{OR}$; wherein R is a sulfate substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfate groups include, but are not limited to, $-\text{OS}(=\text{O})_2\text{OCH}_3$ and $-\text{SO}(=\text{O})_2\text{OCH}_2\text{CH}_3$.

Sulfamyl (sulfamoyl; sulfinic acid amide; sulfinamide): $-\text{S}(=\text{O})\text{NR}^1\text{R}^2$, wherein R^1 and R^2 are independently amino substituents, as defined for amino groups. Examples of sulfamyl groups include, but are not limited to, $-\text{S}(=\text{O})\text{NH}_2$, $-\text{S}(=\text{O})\text{NH}(\text{CH}_3)$, $-\text{S}(=\text{O})\text{N}(\text{CH}_3)_2$, $-\text{S}(=\text{O})\text{NH}(\text{CH}_2\text{CH}_3)$, $-\text{S}(=\text{O})\text{N}(\text{CH}_2\text{CH}_3)_2$, and $-\text{S}(=\text{O})\text{NHPH}$.

Sulfonamido (sulfinamoyl; sulfonic acid amide; sulfonamide): $-\text{S}(=\text{O})_2\text{NR}^1\text{R}^2$, wherein R^1 and R^2 are independently amino substituents, as defined for amino groups. Examples of sulfonamido groups include, but are not limited to, $-\text{S}(=\text{O})_2\text{NH}_2$, $-\text{S}(=\text{O})_2\text{NH}(\text{CH}_3)$, $-\text{S}(=\text{O})_2\text{N}(\text{CH}_3)_2$, $-\text{S}(=\text{O})_2\text{NH}(\text{CH}_2\text{CH}_3)$, $-\text{S}(=\text{O})_2\text{N}(\text{CH}_2\text{CH}_3)_2$, and $-\text{S}(=\text{O})_2\text{NHPH}$.

Sulfamino: $-\text{NR}^1\text{S}(=\text{O})_2\text{OH}$, wherein R^1 is an amino substituent, as defined for amino groups. Examples of sulfamino groups include, but are not limited to, $-\text{NHS}(=\text{O})_2\text{OH}$ and $-\text{N}(\text{CH}_3)\text{S}(=\text{O})_2\text{OH}$.

Sulfonamino: $-\text{NR}^1\text{S}(=\text{O})_2\text{R}$, wherein R^1 is an amino substituent, as defined for amino groups, and R is a sulfonamino substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably a C_{1-7} alkyl group. Examples of sulfonamino groups include, but are not limited to, $-\text{NHS}(=\text{O})_2\text{CH}_3$ and $-\text{N}(\text{CH}_3)\text{S}(=\text{O})_2\text{C}_6\text{H}_5$.

Sulfinamino: $-\text{NR}^1\text{S}(=\text{O})\text{R}$, wherein R^1 is an amino substituent, as defined for amino groups, and R is a sulfinamino substituent, for example, a C_{1-7} alkyl group, a C_{3-20} heterocyclyl group,

or a C₅₋₂₀ aryl group, preferably a C₁₋₇ alkyl group. Examples of sulfinamino groups include, but are not limited to, -NHS(=O)CH₃ and -N(CH₃)S(=O)C₆H₅.

Phosphino (phosphine): -PR₂, wherein R is a phosphino substituent, for example, -H, a C₁₋₇ alkyl group, a C₃₋₂₀ heterocyclyl group, or a C₅₋₂₀ aryl group, preferably -H, a C₁₋₇ alkyl group, or a C₅₋₂₀ aryl group. Examples of phosphino groups include, but are not limited to, -PH₂, -P(CH₃)₂, -P(CH₂CH₃)₂, -P(t-Bu)₂, and -P(Ph)₂.

Phospho: -P(=O)₂.

Phosphinyl (phosphine oxide): -P(=O)R₂, wherein R is a phosphinyl substituent, for example, a C₁₋₇ alkyl group, a C₃₋₂₀ heterocyclyl group, or a C₅₋₂₀ aryl group, preferably a C₁₋₇ alkyl group or a C₅₋₂₀ aryl group. Examples of phosphinyl groups include, but are not limited to, -P(=O)(CH₃)₂, -P(=O)(CH₂CH₃)₂, -P(=O)(t-Bu)₂, and -P(=O)(Ph)₂.

Phosphonic acid (phosphono): -P(=O)(OH)₂.

Phosphonate (phosphono ester): -P(=O)(OR)₂, where R is a phosphonate substituent, for example, -H, a C₁₋₇ alkyl group, a C₃₋₂₀ heterocyclyl group, or a C₅₋₂₀ aryl group, preferably -H, a C₁₋₇ alkyl group, or a C₅₋₂₀ aryl group. Examples of phosphonate groups include, but are not limited to, -P(=O)(OCH₃)₂, -P(=O)(OCH₂CH₃)₂, -P(=O)(O-t-Bu)₂, and -P(=O)(OPh)₂.

Phosphoric acid (phosphonooxy): -OP(=O)(OH)₂.

Phosphate (phosphonooxy ester): -OP(=O)(OR)₂, where R is a phosphate substituent, for example, -H, a C₁₋₇ alkyl group, a C₃₋₂₀ heterocyclyl group, or a C₅₋₂₀ aryl group, preferably -H, a C₁₋₇ alkyl group, or a C₅₋₂₀ aryl group. Examples of phosphate groups include, but are not limited to, -OP(=O)(OCH₃)₂, -OP(=O)(OCH₂CH₃)₂, -OP(=O)(O-t-Bu)₂, and -OP(=O)(OPh)₂.

Phosphorous acid: -OP(OH)₂.

Phosphite: -OP(OR)₂, where R is a phosphite substituent, for example, -H, a C₁₋₇ alkyl group, a C₃₋₂₀ heterocyclyl group, or a C₅₋₂₀ aryl group, preferably -H, a C₁₋₇ alkyl group, or a C₅₋₂₀ aryl group. Examples of phosphite groups include, but are not limited to, -OP(OCH₃)₂, -OP(OCH₂CH₃)₂, -OP(O-t-Bu)₂, and -OP(OPh)₂.

Phosphoramidite: $-\text{OP}(\text{OR}^1)\text{-NR}^2_2$, where R^1 and R^2 are phosphoramidite substituents, for example, $-\text{H}$, a (optionally substituted) C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably $-\text{H}$, a C_{1-7} alkyl group, or a C_{5-20} aryl group. Examples of phosphoramidite groups include, but are not limited to, $-\text{OP}(\text{OCH}_2\text{CH}_3)\text{-N}(\text{CH}_3)_2$, $-\text{OP}(\text{OCH}_2\text{CH}_3)\text{-N}(\text{i-Pr})_2$, and $-\text{OP}(\text{OCH}_2\text{CH}_2\text{CN})\text{-N}(\text{i-Pr})_2$.

Phosphoramidate: $-\text{OP}(=\text{O})(\text{OR}^1)\text{-NR}^2_2$, where R^1 and R^2 are phosphoramidate substituents, for example, $-\text{H}$, a (optionally substituted) C_{1-7} alkyl group, a C_{3-20} heterocyclyl group, or a C_{5-20} aryl group, preferably $-\text{H}$, a C_{1-7} alkyl group, or a C_{5-20} aryl group. Examples of phosphoramidate groups include, but are not limited to, $-\text{OP}(=\text{O})(\text{OCH}_2\text{CH}_3)\text{-N}(\text{CH}_3)_2$, $-\text{OP}(=\text{O})(\text{OCH}_2\text{CH}_3)\text{-N}(\text{i-Pr})_2$, and $-\text{OP}(=\text{O})(\text{OCH}_2\text{CH}_2\text{CN})\text{-N}(\text{i-Pr})_2$.

Alkylene

C_{3-12} alkylene: The term " C_{3-12} alkylene", as used herein, pertains to a bidentate moiety obtained by removing two hydrogen atoms, either both from the same carbon atom, or one from each of two different carbon atoms, of a hydrocarbon compound having from 3 to 12 carbon atoms (unless otherwise specified), which may be aliphatic or alicyclic, and which may be saturated, partially unsaturated, or fully unsaturated. Thus, the term "alkylene" includes the sub-classes alkenylene, alkynylene, cycloalkylene, etc., discussed below.

Examples of linear saturated C_{3-12} alkylene groups include, but are not limited to, $-(\text{CH}_2)_n-$ where n is an integer from 3 to 12, for example, $-\text{CH}_2\text{CH}_2\text{CH}_2-$ (propylene), $-\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$ (butylene), $-\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$ (pentylene) and $-\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2-$ (heptylene).

Examples of branched saturated C_{3-12} alkylene groups include, but are not limited to, $-\text{CH}(\text{CH}_3)\text{CH}_2-$, $-\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2-$, $-\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{CH}_2-$, $-\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2-$, $-\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_2-$, $-\text{CH}(\text{CH}_2\text{CH}_3)-$, $-\text{CH}(\text{CH}_2\text{CH}_3)\text{CH}_2-$, and $-\text{CH}_2\text{CH}(\text{CH}_2\text{CH}_3)\text{CH}_2-$.

Examples of linear partially unsaturated C_{3-12} alkylene groups (C_{3-12} alkenylene, and alkynylene groups) include, but are not limited to, $-\text{CH}=\text{CH}-\text{CH}_2-$, $-\text{CH}_2-\text{CH}=\text{CH}_2-$, $-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_2-$, $-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_2-\text{CH}_2-$, $-\text{CH}=\text{CH}-\text{CH}=\text{CH}-$, $-\text{CH}=\text{CH}-\text{CH}=\text{CH}-\text{CH}_2-$, $-\text{CH}=\text{CH}-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_2-$, $-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}=\text{CH}-$, $-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_2-\text{CH}=\text{CH}-$, and $-\text{CH}_2-\text{C}\equiv\text{C}-\text{CH}_2-$.

Examples of branched partially unsaturated C₃₋₁₂ alkylene groups (C₃₋₁₂ alkenylene and alkynylene groups) include, but are not limited to, -C(CH₃)=CH-, -C(CH₃)=CH-CH₂-, -CH=CH-CH(CH₃)- and -C≡C-CH(CH₃)-.

Examples of alicyclic saturated C₃₋₁₂ alkylene groups (C₃₋₁₂ cycloalkylenes) include, but are not limited to, cyclopentylene (e.g. cyclopent-1,3-ylene), and cyclohexylene (e.g. cyclohex-1,4-ylene).

Examples of alicyclic partially unsaturated C₃₋₁₂ alkylene groups (C₃₋₁₂ cycloalkylenes) include, but are not limited to, cyclopentenylene (e.g. 4-cyclopenten-1,3-ylene), cyclohexenylene (e.g. 2-cyclohexen-1,4-ylene; 3-cyclohexen-1,2-ylene; 2,5-cyclohexadien-1,4-ylene).

Includes Other Forms

Unless otherwise specified, included in the above are the well known ionic, salt, solvate, and protected forms of these substituents. For example, a reference to carboxylic acid (-COOH) also includes the anionic (carboxylate) form (-COO⁻), a salt or solvate thereof, as well as conventional protected forms. Similarly, a reference to an amino group includes the protonated form (-N⁺HR¹R²), a salt or solvate of the amino group, for example, a hydrochloride salt, as well as conventional protected forms of an amino group. Similarly, a reference to a hydroxyl group also includes the anionic form (-O⁻), a salt or solvate thereof, as well as conventional protected forms.

Salts

It may be convenient or desirable to prepare, purify, and/or handle a corresponding salt of the active compound, for example, a pharmaceutically-acceptable salt. Examples of pharmaceutically acceptable salts are discussed in Berge, *et al.*, *J. Pharm. Sci.*, **66**, 1-19 (1977).

For example, if the compound is anionic, or has a functional group which may be anionic (e.g. -COOH may be -COO⁻), then a salt may be formed with a suitable cation. Examples of suitable inorganic cations include, but are not limited to, alkali metal ions such as Na⁺ and K⁺, alkaline earth cations such as Ca²⁺ and Mg²⁺, and other cations such as Al⁺³. Examples of suitable organic cations include, but are not limited to, ammonium ion (i.e. NH₄⁺) and substituted ammonium ions (e.g. NH₃R⁺, NH₂R₂⁺, NHR₃⁺, NR₄⁺). Examples of some suitable substituted ammonium ions are those derived from: ethylamine, diethylamine,

These forms can be called the carbinolamine and carbinolamine ether forms of the PBD (as described in the section relating to R¹⁰ above). The balance of these equilibria depend on the conditions in which the compounds are found, as well as the nature of the moiety itself.

These particular compounds may be isolated in solid form, for example, by lyophilisation.

Isomers

Certain compounds of the invention may exist in one or more particular geometric, optical, enantiomeric, diastereomeric, epimeric, atropic, stereoisomeric, tautomeric, conformational, or anomeric forms, including but not limited to, cis- and trans-forms; E- and Z-forms; c-, t-, and r- forms; endo- and exo-forms; R-, S-, and meso-forms; D- and L-forms; d- and l-forms; (+) and (-) forms; keto-, enol-, and enolate-forms; syn- and anti-forms; synclinal- and anticlinal-forms; α - and β -forms; axial and equatorial forms; boat-, chair-, twist-, envelope-, and halfchair-forms; and combinations thereof, hereinafter collectively referred to as "isomers" (or "isomeric forms").

The term "chiral" refers to molecules which have the property of non-superimposability of the mirror image partner, while the term "achiral" refers to molecules which are superimposable on their mirror image partner.

The term "stereoisomers" refers to compounds which have identical chemical constitution, but differ with regard to the arrangement of the atoms or groups in space.

"Diastereomer" refers to a stereoisomer with two or more centers of chirality and whose molecules are not mirror images of one another. Diastereomers have different physical properties, e.g. melting points, boiling points, spectral properties, and reactivities. Mixtures of diastereomers may separate under high resolution analytical procedures such as electrophoresis and chromatography.

"Enantiomers" refer to two stereoisomers of a compound which are non-superimposable mirror images of one another.

Stereochemical definitions and conventions used herein generally follow S. P. Parker, Ed., *McGraw-Hill Dictionary of Chemical Terms* (1984) McGraw-Hill Book Company, New York; and Eliel, E. and Wilen, S., "Stereochemistry of Organic Compounds", John Wiley & Sons, Inc., New York, 1994. The compounds of the invention may contain asymmetric or chiral

centers, and therefore exist in different stereoisomeric forms. It is intended that all stereoisomeric forms of the compounds of the invention, including but not limited to, diastereomers, enantiomers and atropisomers, as well as mixtures thereof such as racemic mixtures, form part of the present invention. Many organic compounds exist in optically active forms, i.e., they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L, or R and S, are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the compound is levorotatory. A compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where there has been no stereoselection or stereospecificity in a chemical reaction or process. The terms "racemic mixture" and "racemate" refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

Note that, except as discussed below for tautomeric forms, specifically excluded from the term "isomers", as used herein, are structural (or constitutional) isomers (i.e. isomers which differ in the connections between atoms rather than merely by the position of atoms in space). For example, a reference to a methoxy group, -OCH₃, is not to be construed as a reference to its structural isomer, a hydroxymethyl group, -CH₂OH. Similarly, a reference to ortho-chlorophenyl is not to be construed as a reference to its structural isomer, meta-chlorophenyl. However, a reference to a class of structures may well include structurally isomeric forms falling within that class (e.g. C₁₋₇ alkyl includes n-propyl and iso-propyl; butyl includes n-, iso-, sec-, and tert-butyl; methoxyphenyl includes ortho-, meta-, and para-methoxyphenyl).

The above exclusion does not pertain to tautomeric forms, for example, keto-, enol-, and enolate-forms, as in, for example, the following tautomeric pairs: keto/enol (illustrated below), imine/enamine, amide/imino alcohol, amidine/amidine, nitroso/oxime, thioketone/enethiol, N-nitroso/hydroxyazo, and nitro/aci-nitro.

The term "tautomer" or "tautomeric form" refers to structural isomers of different energies which are interconvertible via a low energy barrier. For example, proton tautomers (also known as prototropic tautomers) include interconversions via migration of a proton, such as keto-enol and imine-enamine isomerizations. Valence tautomers include interconversions by reorganization of some of the bonding electrons.

Note that specifically included in the term "isomer" are compounds with one or more isotopic substitutions. For example, H may be in any isotopic form, including ^1H , ^2H (D), and ^3H (T); C may be in any isotopic form, including ^{12}C , ^{13}C , and ^{14}C ; O may be in any isotopic form, including ^{16}O and ^{18}O ; and the like.

Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as, but not limited to ^2H (deuterium, D), ^3H (tritium), ^{11}C , ^{13}C , ^{14}C , ^{15}N , ^{18}F , ^{31}P , ^{32}P , ^{35}S , ^{36}Cl , and ^{125}I . Various isotopically labeled compounds of the present invention, for example those into which radioactive isotopes such as ^3H , ^{13}C , and ^{14}C are incorporated. Such isotopically labelled compounds may be useful in metabolic studies, reaction kinetic studies, detection or imaging techniques, such as positron emission tomography (PET) or single-photon emission computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. Deuterium labelled or substituted therapeutic compounds of the invention may have improved DMPK (drug metabolism and pharmacokinetics) properties, relating to distribution, metabolism, and excretion (ADME). Substitution with heavier isotopes such as deuterium may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements. An ^{18}F labeled compound may be useful for PET or SPECT studies. Isotopically labeled compounds of this invention and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the schemes or in the examples and preparations described below by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent. Further, substitution with heavier isotopes, particularly deuterium (i.e., ^2H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage requirements or an improvement in therapeutic index. It is understood that deuterium in this context is regarded as a substituent. The concentration of such a heavier isotope, specifically deuterium, may be defined by an isotopic enrichment factor. In the compounds of

this invention any atom not specifically designated as a particular isotope is meant to represent any stable isotope of that atom.

Unless otherwise specified, a reference to a particular compound includes all such isomeric forms, including (wholly or partially) racemic and other mixtures thereof. Methods for the preparation (e.g. asymmetric synthesis) and separation (e.g. fractional crystallisation and chromatographic means) of such isomeric forms are either known in the art or are readily obtained by adapting the methods taught herein, or known methods, in a known manner.

Biological Activity

In vitro cell proliferation assays

Generally, the cytotoxic or cytostatic activity of an antibody-drug conjugate (ADC) is measured by: exposing mammalian cells having receptor proteins, e.g. HER2, to the antibody of the ADC in a cell culture medium; culturing the cells for a period from about 6 hours to about 5 days; and measuring cell viability. Cell-based *in vitro* assays are used to measure viability (proliferation), cytotoxicity, and induction of apoptosis (caspase activation) of an ADC of the invention.

The *in vitro* potency of antibody-drug conjugates can be measured by a cell proliferation assay. The CellTiter-Glo[®] Luminescent Cell Viability Assay is a commercially available (Promega Corp., Madison, WI), homogeneous assay method based on the recombinant expression of *Coleoptera* luciferase (US Patent Nos. 5583024; 5674713 and 5700670). This cell proliferation assay determines the number of viable cells in culture based on quantitation of the ATP present, an indicator of metabolically active cells (Crouch *et al* (1993) *J. Immunol. Meth.* 160:81-88; US 6602677). The CellTiter-Glo[®] Assay is conducted in 96 well format, making it amenable to automated high-throughput screening (HTS) (Cree *et al* (1995) *AntiCancer Drugs* 6:398-404). The homogeneous assay procedure involves adding the single reagent (CellTiter-Glo[®] Reagent) directly to cells cultured in serum-supplemented medium. Cell washing, removal of medium and multiple pipetting steps are not required. The system detects as few as 15 cells/well in a 384-well format in 10 minutes after adding reagent and mixing. The cells may be treated continuously with ADC, or they may be treated and separated from ADC. Generally, cells treated briefly, i.e. 3 hours, showed the same potency effects as continuously treated cells.

The homogeneous "add-mix-measure" format results in cell lysis and generation of a luminescent signal proportional to the amount of ATP present. The amount of ATP is directly

proportional to the number of cells present in culture. The CellTiter-Glo[®] Assay generates a "glow-type" luminescent signal, produced by the luciferase reaction, which has a half-life generally greater than five hours, depending on cell type and medium used. Viable cells are reflected in relative luminescence units (RLU). The substrate, Beetle Luciferin, is oxidatively decarboxylated by recombinant firefly luciferase with concomitant conversion of ATP to AMP and generation of photons.

In vivo efficacy

The *in vivo* efficacy of antibody-drug conjugates (ADC) of the invention can be measured by tumor xenograft studies in mice. For example, the *in vivo* efficacy of an anti-HER2 ADC of the invention can be measured by a high expressing HER2 transgenic explant mouse model. An allograft is propagated from the Fo5 mmtv transgenic mouse which does not respond to, or responds poorly to, HERCEPTIN[®] therapy. Subjects were treated once with ADC at certain dose levels (mg/kg) and PBD drug exposure ($\mu\text{g}/\text{m}^2$); and placebo buffer control (Vehicle) and monitored over two weeks or more to measure the time to tumor doubling, log cell kill, and tumor shrinkage.

Use

The conjugates of the invention may be used to provide a PBD conjugate at a target location.

The target location is preferably a proliferative cell population. The antibody is an antibody for an antigen present in a proliferative cell population.

In one embodiment the antigen is absent or present at a reduced level in a non-proliferative cell population compared to the amount of antigen present in the proliferative cell population, for example a tumour cell population.

The target location may be *in vitro*, *in vivo* or *ex vivo*.

The antibody-drug conjugate (ADC) compounds of the invention include those with utility for anticancer activity. In particular, the compounds include an antibody conjugated, i.e. covalently attached by a linker, to a PBD moiety.

At the target location the linker may not be cleaved. The antibody-drug conjugate (ADC) compounds of the invention may have a cytotoxic effect without the cleavage of the linker to

release a PBD drug moiety. The antibody-drug conjugates (ADC) of the invention selectively deliver cytotoxic agent to tumor tissue whereby greater selectivity, i.e. a lower efficacious dose, may be achieved.

Thus, in one aspect, the present invention provides a conjugate compound as described herein for use in therapy.

In a further aspect there is also provides a conjugate compound as described herein for use in the treatment of a proliferative disease. A second aspect of the present invention provides the use of a conjugate compound in the manufacture of a medicament for treating a proliferative disease.

One of ordinary skill in the art is readily able to determine whether or not a candidate conjugate treats a proliferative condition for any particular cell type. For example, assays which may conveniently be used to assess the activity offered by a particular compound are described in the examples below.

The term "proliferative disease" pertains to an unwanted or uncontrolled cellular proliferation of excessive or abnormal cells which is undesired, such as, neoplastic or hyperplastic growth, whether *in vitro* or *in vivo*.

Examples of proliferative conditions include, but are not limited to, benign, pre-malignant, and malignant cellular proliferation, including but not limited to, neoplasms and tumours (e.g. histocytoma, glioma, astrocytoma, osteoma), cancers (e.g. lung cancer, small cell lung cancer, gastrointestinal cancer, bowel cancer, colon cancer, breast carcinoma, ovarian carcinoma, prostate cancer, testicular cancer, liver cancer, kidney cancer, bladder cancer, pancreas cancer, brain cancer, sarcoma, osteosarcoma, Kaposi's sarcoma, melanoma), leukemias, psoriasis, bone diseases, fibroproliferative disorders (e.g. of connective tissues), and atherosclerosis. Cancers of particular interest include, but are not limited to, leukemias and ovarian cancers.

Any type of cell may be treated, including but not limited to, lung, gastrointestinal (including, e.g. bowel, colon), breast (mammary), ovarian, prostate, liver (hepatic), kidney (renal), bladder, pancreas, brain, and skin.

In one embodiment, the treatment is of a pancreatic cancer.

In one embodiment, the treatment is of a tumour having $\alpha_v\beta_6$ integrin on the surface of the cell.

It is contemplated that the antibody-drug conjugates (ADC) of the present invention may be used to treat various diseases or disorders, e.g. characterized by the overexpression of a tumor antigen. Exemplary conditions or hyperproliferative disorders include benign or malignant tumors; leukemia, haematological, and lymphoid malignancies. Others include neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, epithelial, stromal, blastocoelic, inflammatory, angiogenic and immunologic, including autoimmune, disorders.

Generally, the disease or disorder to be treated is a hyperproliferative disease such as cancer. Examples of cancer to be treated herein include, but are not limited to, carcinoma, lymphoma, blastoma, sarcoma, and leukemia or lymphoid malignancies. More particular examples of such cancers include squamous cell cancer (e.g. epithelial squamous cell cancer), lung cancer including small-cell lung cancer, non-small cell lung cancer, adenocarcinoma of the lung and squamous carcinoma of the lung, cancer of the peritoneum, hepatocellular cancer, gastric or stomach cancer including gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical cancer, ovarian cancer, liver cancer, bladder cancer, hepatoma, breast cancer, colon cancer, rectal cancer, colorectal cancer, endometrial or uterine carcinoma, salivary gland carcinoma, kidney or renal cancer, prostate cancer, vulval cancer, thyroid cancer, hepatic carcinoma, anal carcinoma, penile carcinoma, as well as head and neck cancer.

Autoimmune diseases for which the ADC compounds may be used in treatment include rheumatologic disorders (such as, for example, rheumatoid arthritis, Sjögren's syndrome, scleroderma, lupus such as SLE and lupus nephritis, polymyositis/dermatomyositis, cryoglobulinemia, anti-phospholipid antibody syndrome, and psoriatic arthritis), osteoarthritis, autoimmune gastrointestinal and liver disorders (such as, for example, inflammatory bowel diseases (e.g. ulcerative colitis and Crohn's disease), autoimmune gastritis and pernicious anemia, autoimmune hepatitis, primary biliary cirrhosis, primary sclerosing cholangitis, and celiac disease), vasculitis (such as, for example, ANCA-associated vasculitis, including Churg-Strauss vasculitis, Wegener's granulomatosis, and polyarteriitis), autoimmune neurological disorders (such as, for example, multiple sclerosis, opsoclonus myoclonus syndrome, myasthenia gravis, neuromyelitis optica, Parkinson's disease, Alzheimer's disease, and autoimmune polyneuropathies), renal disorders (such as, for example, glomerulonephritis, Goodpasture's syndrome, and Berger's disease), autoimmune

dermatologic disorders (such as, for example, psoriasis, urticaria, hives, pemphigus vulgaris, bullous pemphigoid, and cutaneous lupus erythematosus), hematologic disorders (such as, for example, thrombocytopenic purpura, thrombotic thrombocytopenic purpura, post-transfusion purpura, and autoimmune hemolytic anemia), atherosclerosis, uveitis, autoimmune hearing diseases (such as, for example, inner ear disease and hearing loss), Behcet's disease, Raynaud's syndrome, organ transplant, and autoimmune endocrine disorders (such as, for example, diabetic-related autoimmune diseases such as insulin-dependent diabetes mellitus (IDDM), Addison's disease, and autoimmune thyroid disease (e.g. Graves' disease and thyroiditis)). More preferred such diseases include, for example, rheumatoid arthritis, ulcerative colitis, ANCA-associated vasculitis, lupus, multiple sclerosis, Sjögren's syndrome, Graves' disease, IDDM, pernicious anemia, thyroiditis, and glomerulonephritis.

Methods of Treatment

The conjugates of the present invention may be used in a method of therapy. Also provided is a method of treatment, comprising administering to a subject in need of treatment a therapeutically-effective amount of a conjugate compound of the invention. The term "therapeutically effective amount" is an amount sufficient to show benefit to a patient. Such benefit may be at least amelioration of at least one symptom. The actual amount administered, and rate and time-course of administration, will depend on the nature and severity of what is being treated. Prescription of treatment, e.g. decisions on dosage, is within the responsibility of general practitioners and other medical doctors.

A compound of the invention may be administered alone or in combination with other treatments, either simultaneously or sequentially dependent upon the condition to be treated. Examples of treatments and therapies include, but are not limited to, chemotherapy (the administration of active agents, including, e.g. drugs, such as chemotherapeutics); surgery; and radiation therapy.

A "chemotherapeutic agent" is a chemical compound useful in the treatment of cancer, regardless of mechanism of action. Classes of chemotherapeutic agents include, but are not limited to: alkylating agents, antimetabolites, spindle poison plant alkaloids, cytotoxic/antitumor antibiotics, topoisomerase inhibitors, antibodies, photosensitizers, and kinase inhibitors. Chemotherapeutic agents include compounds used in "targeted therapy" and conventional chemotherapy.

Examples of chemotherapeutic agents include: erlotinib (TARCEVA®, Genentech/OSI Pharm.), docetaxel (TAXOTERE®, Sanofi-Aventis), 5-FU (fluorouracil, 5-fluorouracil, CAS No. 51-21-8), gemcitabine (GEMZAR®, Lilly), PD-0325901 (CAS No. 391210-10-9, Pfizer), cisplatin (cis-diamine, dichloroplatinum(II), CAS No. 15663-27-1), carboplatin (CAS No. 41575-94-4), paclitaxel (TAXOL®, Bristol-Myers Squibb Oncology, Princeton, N.J.), trastuzumab (HERCEPTIN®, Genentech), temozolomide (4-methyl-5-oxo-2,3,4,6,8-pentazabicyclo [4.3.0] nona-2,7,9-triene-9-carboxamide, CAS No. 85622-93-1, TEMODAR®, TEMODAL®, Schering Plough), tamoxifen ((Z)-2-[4-(1,2-diphenylbut-1-enyl)phenoxy]-N,N-dimethylethanamine, NOLVADEX®, ISTUBAL®, VALODEX®), and doxorubicin (ADRIAMYCIN®), Akti-1/2, HPPD, and rapamycin.

More examples of chemotherapeutic agents include: oxaliplatin (ELOXATIN®, Sanofi), bortezomib (VELCADE®, Millennium Pharm.), sunitinib (SUNITINIB®, SU11248, Pfizer), letrozole (FEMARA®, Novartis), imatinib mesylate (GLEEVEC®, Novartis), XL-518 (Mek inhibitor, Exelixis, WO 2007/044515), ARRY-886 (Mek inhibitor, AZD6244, Array BioPharma, Astra Zeneca), SF-1126 (PI3K inhibitor, Semafore Pharmaceuticals), BEZ-235 (PI3K inhibitor, Novartis), XL-147 (PI3K inhibitor, Exelixis), PTK787/ZK 222584 (Novartis), fulvestrant (FASLODEX®, AstraZeneca), leucovorin (folinic acid), rapamycin (sirolimus, RAPAMUNE®, Wyeth), lapatinib (TYKERB®, GSK572016, Glaxo Smith Kline), lonafarnib (SARASAR™, SCH 66336, Schering Plough), sorafenib (NEXAVAR®, BAY43-9006, Bayer Labs), gefitinib (IRESSA®, AstraZeneca), irinotecan (CAMPTOSAR®, CPT-11, Pfizer), tipifarnib (ZARNESTRA™, Johnson & Johnson), ABRAXANE™ (Cremophor-free), albumin-engineered nanoparticle formulations of paclitaxel (American Pharmaceutical Partners, Schaumburg, IL), vandetanib (RINN, ZD6474, ZACTIMA®, AstraZeneca), chlorambucil, AG1478, AG1571 (SU 5271; Sugen), temsirolimus (TORISEL®, Wyeth), pazopanib (GlaxoSmithKline), canfosfamide (TELCYTA®, Telik), thiotepa and cyclophosphamide (CYTOXAN®, NEOSAR®); alkyl sulfonates such as busulfan, improsulfan and piposulfan; aziridines such as benzodopa, carboquone, meturedopa, and uredopa; ethylenimines and methylamelamines including altretamine, triethylenemelamine, triethylenephosphoramidate, triethylenethiophosphoramidate and trimethylmelamine; acetogenins (especially bullatacin and bullatacinone); a camptothecin (including the synthetic analog topotecan); bryostatin; callystatin; CC-1065 (including its adozelesin, carzelesin and bizelesin synthetic analogs); cryptophycins (particularly cryptophycin 1 and cryptophycin 8); dolastatin; duocarmycin (including the synthetic analogs, KW-2189 and CB1-TM1); eleutherobin; pancratistatin; a sarcodictyin; spongistatin; nitrogen mustards such as chlorambucil, chlornaphazine, chlorophosphamide, estramustine, ifosfamide, mechlorethamine, mechlorethamine oxide hydrochloride, melphalan, novembichin, phenesterine, prednimustine, trofosfamide, uracil

mustard; nitrosoureas such as carmustine, chlorozotocin, fotemustine, lomustine, nimustine, and ranimustine; antibiotics such as the enediyne antibiotics (e.g. calicheamicin, calicheamicin gamma11, calicheamicin omegal1 (*Angew Chem. Intl. Ed. Engl.* (1994) 33:183-186); dynemicin, dynemicin A; bisphosphonates, such as clodronate; an esperamicin; as well as neocarzinostatin chromophore and related chromoprotein enediyne antibiotic chromophores), aclacinomysins, actinomycin, authramycin, azaserine, bleomycins, cactinomycin, carabycin, carminomycin, carzinophilin, chromomycinis, dactinomycin, daunorubicin, detorubicin, 6-diazo-5-oxo-L-norleucine, morpholino-doxorubicin, cyanomorpholino-doxorubicin, 2-pyrrolino-doxorubicin and deoxydoxorubicin), epirubicin, esorubicin, idarubicin, nemorubicin, marcellomycin, mitomycins such as mitomycin C, mycophenolic acid, nogalamycin, olivomycins, peplomycin, porfiromycin, puromycin, quelamycin, rodorubicin, streptonigrin, streptozocin, tubercidin, ubenimex, zinostatin, zorubicin; anti-metabolites such as methotrexate and 5-fluorouracil (5-FU); folic acid analogs such as denopterin, methotrexate, pteropterin, trimetrexate; purine analogs such as fludarabine, 6-mercaptopurine, thiamiprine, thioguanine; pyrimidine analogs such as ancitabine, azacitidine, 6-azauridine, carmofur, cytarabine, dideoxyuridine, doxifluridine, enocitabine, floxuridine; androgens such as calusterone, dromostanolone propionate, epitio stanol, mepitio stanol, testolactone; anti-adrenals such as aminoglutethimide, mitotane, trilostane; folic acid replenisher such as frolinic acid; aceglatone; aldophosphamide glycoside; aminolevulinic acid; eniluracil; amsacrine; bestrabucil; bisantrene; edatraxate; defofamine; demecolcine; diaziquone; elfornithine; elliptinium acetate; an epothilone; etoglucid; gallium nitrate; hydroxyurea; lentinan; lonidainine; maytansinoids such as maytansine and ansamitocins; mitoguazone; mitoxantrone; mopidanmol; nitraerine; pentostatin; phenamet; pirarubicin; losoxantrone; podophyllinic acid; 2-ethylhydrazide; procarbazine; PSK® polysaccharide complex (JHS Natural Products, Eugene, OR); razoxane; rhizoxin; sizofiran; spirogermanium; tenuazonic acid; triaziquone; 2,2',2"-trichlorotriethylamine; trichothecenes (especially T-2 toxin, verracurin A, roridin A and anguidine); urethan; vindesine; dacarbazine; mannomustine; mitobronitol; mitolactol; pipobroman; gacytosine; arabinoside ("Ara-C"); cyclophosphamide; thiotepa; 6-thioguanine; mercaptopurine; methotrexate; platinum analogs such as cisplatin and carboplatin; vinblastine; etoposide (VP-16); ifosfamide; mitoxantrone; vincristine; vinorelbine (NAVELBINE®); novantrone; teniposide; edatrexate; daunomycin; aminopterin; capecitabine (XELODA®, Roche); ibandronate; CPT-11; topoisomerase inhibitor RFS 2000; difluoromethylornithine (DMFO); retinoids such as retinoic acid; and pharmaceutically acceptable salts, acids and derivatives of any of the above.

Also included in the definition of "chemotherapeutic agent" are: (i) anti-hormonal agents that act to regulate or inhibit hormone action on tumors such as anti-estrogens and selective estrogen receptor modulators (SERMs), including, for example, tamoxifen (including NOLVADEX®; tamoxifen citrate), raloxifene, droloxifene, 4-hydroxytamoxifen, trioxifene, keoxifene, LY117018, onapristone, and FARESTON® (toremifine citrate); (ii) aromatase inhibitors that inhibit the enzyme aromatase, which regulates estrogen production in the adrenal glands, such as, for example, 4(5)-imidazoles, aminoglutethimide, MEGASE® (megestrol acetate), AROMASIN® (exemestane; Pfizer), formestanie, fadrozole, RIVISOR® (vorozole), FEMARA® (letrozole; Novartis), and ARIMIDEX® (anastrozole; AstraZeneca); (iii) anti-androgens such as flutamide, nilutamide, bicalutamide, leuprolide, and goserelin; as well as troxacitabine (a 1,3-dioxolane nucleoside cytosine analog); (iv) protein kinase inhibitors such as MEK inhibitors (WO 2007/044515); (v) lipid kinase inhibitors; (vi) antisense oligonucleotides, particularly those which inhibit expression of genes in signaling pathways implicated in aberrant cell proliferation, for example, PKC-alpha, Raf and H-Ras, such as oblimersen (GENASENSE®, Genta Inc.); (vii) ribozymes such as VEGF expression inhibitors (e.g., ANGIOZYME®) and HER2 expression inhibitors; (viii) vaccines such as gene therapy vaccines, for example, ALLOVECTIN®, LEUVECTIN®, and VAXID®; PROLEUKIN® rIL-2; topoisomerase 1 inhibitors such as LURTOTECAN®; ABARELIX® mRH; (ix) anti-angiogenic agents such as bevacizumab (AVASTIN®, Genentech); and pharmaceutically acceptable salts, acids and derivatives of any of the above.

Also included in the definition of "chemotherapeutic agent" are therapeutic antibodies such as alemtuzumab (Campath), bevacizumab (AVASTIN®, Genentech); cetuximab (ERBITUX®, Imclone); panitumumab (VECTIBIX®, Amgen), rituximab (RITUXAN®, Genentech/Biogen Idec), pertuzumab (OMNITARG™, 2C4, Genentech), trastuzumab (HERCEPTIN®, Genentech), tositumomab (Bexxar, Corixa), and the antibody drug conjugate, gemtuzumab ozogamicin (MYLOTARG®, Wyeth).

Humanized monoclonal antibodies with therapeutic potential as chemotherapeutic agents in combination with the conjugates of the invention include: alemtuzumab, apolizumab, aselizumab, atlizumab, bapineuzumab, bevacizumab, bivatumumab mertansine, cantuzumab mertansine, cedelizumab, certolizumab pegol, cidfusituzumab, cidtuzumab, daclizumab, eculizumab, efalizumab, epratuzumab, erlizumab, felvizumab, fontolizumab, gemtuzumab ozogamicin, inotuzumab ozogamicin, ipilimumab, labetuzumab, lintuzumab, matuzumab, mepolizumab, motavizumab, motovizumab, natalizumab, nimotuzumab, nolovizumab, numavizumab, ocrelizumab, omalizumab, palivizumab, pascolizumab, pecfusituzumab, pectuzumab, pertuzumab, pexelizumab, ralivizumab, ranibizumab, reslivizumab, reslizumab,

resyvizumab, rovelizumab, ruplizumab, sibrotuzumab, siplizumab, sontuzumab, tacatuzumab tetraxetan, tadocizumab, talizumab, tefibazumab, tocilizumab, toralizumab, trastuzumab, tucotuzumab celmoleukin, tucosituzumab, umavizumab, urtoxazumab, and visilizumab.

Pharmaceutical compositions according to the present invention, and for use in accordance with the present invention, may comprise, in addition to the active ingredient, i.e. a conjugate compound, a pharmaceutically acceptable excipient, carrier, buffer, stabiliser or other materials well known to those skilled in the art. Such materials should be non-toxic and should not interfere with the efficacy of the active ingredient. The precise nature of the carrier or other material will depend on the route of administration, which may be oral, or by injection, e.g. cutaneous, subcutaneous, or intravenous.

Pharmaceutical compositions for oral administration may be in tablet, capsule, powder or liquid form. A tablet may comprise a solid carrier or an adjuvant. Liquid pharmaceutical compositions generally comprise a liquid carrier such as water, petroleum, animal or vegetable oils, mineral oil or synthetic oil. Physiological saline solution, dextrose or other saccharide solution or glycols such as ethylene glycol, propylene glycol or polyethylene glycol may be included. A capsule may comprise a solid carrier such a gelatin.

For intravenous, cutaneous or subcutaneous injection, or injection at the site of affliction, the active ingredient will be in the form of a parenterally acceptable aqueous solution which is pyrogen-free and has suitable pH, isotonicity and stability. Those of relevant skill in the art are well able to prepare suitable solutions using, for example, isotonic vehicles such as Sodium Chloride Injection, Ringer's Injection, Lactated Ringer's Injection. Preservatives, stabilisers, buffers, antioxidants and/or other additives may be included, as required.

Formulations

While it is possible for the conjugate compound to be used (e.g., administered) alone, it is often preferable to present it as a composition or formulation.

In one embodiment, the composition is a pharmaceutical composition (e.g., formulation, preparation, medicament) comprising a conjugate compound, as described herein, and a pharmaceutically acceptable carrier, diluent, or excipient.

In one embodiment, the composition is a pharmaceutical composition comprising at least one conjugate compound, as described herein, together with one or more other pharmaceutically acceptable ingredients well known to those skilled in the art, including, but not limited to, pharmaceutically acceptable carriers, diluents, excipients, adjuvants, fillers, buffers, preservatives, anti-oxidants, lubricants, stabilisers, solubilisers, surfactants (e.g., wetting agents), masking agents, colouring agents, flavouring agents, and sweetening agents.

In one embodiment, the composition further comprises other active agents, for example, other therapeutic or prophylactic agents.

Suitable carriers, diluents, excipients, etc. can be found in standard pharmaceutical texts. See, for example, Handbook of Pharmaceutical Additives, 2nd Edition (eds. M. Ash and I. Ash), 2001 (Synapse Information Resources, Inc., Endicott, New York, USA), Remington's Pharmaceutical Sciences, 20th edition, pub. Lippincott, Williams & Wilkins, 2000; and Handbook of Pharmaceutical Excipients, 2nd edition, 1994.

Another aspect of the present invention pertains to methods of making a pharmaceutical composition comprising admixing at least one [¹¹C]-radiolabelled conjugate or conjugate-like compound, as defined herein, together with one or more other pharmaceutically acceptable ingredients well known to those skilled in the art, e.g., carriers, diluents, excipients, etc. If formulated as discrete units (e.g., tablets, etc.), each unit contains a predetermined amount (dosage) of the active compound.

The term "pharmaceutically acceptable," as used herein, pertains to compounds, ingredients, materials, compositions, dosage forms, etc., which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of the subject in question (e.g., human) without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio. Each carrier, diluent, excipient, etc. must also be "acceptable" in the sense of being compatible with the other ingredients of the formulation.

The formulations may be prepared by any methods well known in the art of pharmacy. Such methods include the step of bringing into association the active compound with a carrier which constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active compound with

carriers (e.g., liquid carriers, finely divided solid carrier, etc.), and then shaping the product, if necessary.

The formulation may be prepared to provide for rapid or slow release; immediate, delayed, timed, or sustained release; or a combination thereof.

Formulations suitable for parenteral administration (e.g., by injection), include aqueous or non-aqueous, isotonic, pyrogen-free, sterile liquids (e.g., solutions, suspensions), in which the active ingredient is dissolved, suspended, or otherwise provided (e.g., in a liposome or other microparticulate). Such liquids may additionally contain other pharmaceutically acceptable ingredients, such as anti-oxidants, buffers, preservatives, stabilisers, bacteriostats, suspending agents, thickening agents, and solutes which render the formulation isotonic with the blood (or other relevant bodily fluid) of the intended recipient. Examples of excipients include, for example, water, alcohols, polyols, glycerol, vegetable oils, and the like. Examples of suitable isotonic carriers for use in such formulations include Sodium Chloride Injection, Ringer's Solution, or Lactated Ringer's Injection. Typically, the concentration of the active ingredient in the liquid is from about 1 ng/ml to about 10 µg/ml, for example from about 10 ng/ml to about 1 µg/ml. The formulations may be presented in unit-dose or multi-dose sealed containers, for example, ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules, and tablets.

Dosage

It will be appreciated by one of skill in the art that appropriate dosages of the conjugate compound, and compositions comprising the conjugate compound, can vary from patient to patient. Determining the optimal dosage will generally involve the balancing of the level of therapeutic benefit against any risk or deleterious side effects. The selected dosage level will depend on a variety of factors including, but not limited to, the activity of the particular compound, the route of administration, the time of administration, the rate of excretion of the compound, the duration of the treatment, other drugs, compounds, and/or materials used in combination, the severity of the condition, and the species, sex, age, weight, condition, general health, and prior medical history of the patient. The amount of compound and route of administration will ultimately be at the discretion of the physician, veterinarian, or clinician, although generally the dosage will be selected to achieve local concentrations at the site of

action which achieve the desired effect without causing substantial harmful or deleterious side-effects.

Administration can be effected in one dose, continuously or intermittently (e.g., in divided doses at appropriate intervals) throughout the course of treatment. Methods of determining the most effective means and dosage of administration are well known to those of skill in the art and will vary with the formulation used for therapy, the purpose of the therapy, the target cell(s) being treated, and the subject being treated. Single or multiple administrations can be carried out with the dose level and pattern being selected by the treating physician, veterinarian, or clinician.

In general, a suitable dose of the active compound is in the range of about 100 ng to about 25 mg (more typically about 1 μ g to about 10 mg) per kilogram body weight of the subject per day. Where the active compound is a salt, an ester, an amide, a prodrug, or the like, the amount administered is calculated on the basis of the parent compound and so the actual weight to be used is increased proportionately.

In one embodiment, the active compound is administered to a human patient according to the following dosage regime: about 100 mg, 3 times daily.

In one embodiment, the active compound is administered to a human patient according to the following dosage regime: about 150 mg, 2 times daily.

In one embodiment, the active compound is administered to a human patient according to the following dosage regime: about 200 mg, 2 times daily.

However in one embodiment, the conjugate compound is administered to a human patient according to the following dosage regime: about 50 or about 75 mg, 3 or 4 times daily.

In one embodiment, the conjugate compound is administered to a human patient according to the following dosage regime: about 100 or about 125 mg, 2 times daily.

The dosage amounts described above may apply to the conjugate (including the PBD moiety and the linker to the antibody) or to the effective amount of PBD compound provided, for example the amount of compound that is releasable after cleavage of the linker.

For the prevention or treatment of disease, the appropriate dosage of an ADC of the invention will depend on the type of disease to be treated, as defined above, the severity and course of the disease, whether the molecule is administered for preventive or therapeutic purposes, previous therapy, the patient's clinical history and response to the antibody, and the discretion of the attending physician. The molecule is suitably administered to the patient at one time or over a series of treatments. Depending on the type and severity of the disease, about 1 $\mu\text{g}/\text{kg}$ to 15 mg/kg (e.g. 0.1-20 mg/kg) of molecule is an initial candidate dosage for administration to the patient, whether, for example, by one or more separate administrations, or by continuous infusion. A typical daily dosage might range from about 1 $\mu\text{g}/\text{kg}$ to 100 mg/kg or more, depending on the factors mentioned above. An exemplary dosage of ADC to be administered to a patient is in the range of about 0.1 to about 10 mg/kg of patient weight. For repeated administrations over several days or longer, depending on the condition, the treatment is sustained until a desired suppression of disease symptoms occurs. An exemplary dosing regimen comprises a course of administering an initial loading dose of about 4 mg/kg , followed by additional doses every week, two weeks, or three weeks of an ADC. Other dosage regimens may be useful. The progress of this therapy is easily monitored by conventional techniques and assays.

Treatment

The term "treatment," as used herein in the context of treating a condition, pertains generally to treatment and therapy, whether of a human or an animal (e.g., in veterinary applications), in which some desired therapeutic effect is achieved, for example, the inhibition of the progress of the condition, and includes a reduction in the rate of progress, a halt in the rate of progress, regression of the condition, amelioration of the condition, and cure of the condition. Treatment as a prophylactic measure (i.e., prophylaxis, prevention) is also included.

The term "therapeutically-effective amount," as used herein, pertains to that amount of an active compound, or a material, composition or dosage from comprising an active compound, which is effective for producing some desired therapeutic effect, commensurate with a reasonable benefit/risk ratio, when administered in accordance with a desired treatment regimen.

Similarly, the term "prophylactically-effective amount," as used herein, pertains to that amount of an active compound, or a material, composition or dosage from comprising an active compound, which is effective for producing some desired prophylactic effect,

commensurate with a reasonable benefit/risk ratio, when administered in accordance with a desired treatment regimen.

Preparation of Antibody drug conjugates

Antibody drug conjugates may be prepared by several routes, employing organic chemistry reactions, conditions, and reagents known to those skilled in the art, including: (1) reaction of a nucleophilic group of an antibody with a bivalent linker reagent, to form antibody-linker intermediate Ab-L, via a covalent bond, followed by reaction with an activated drug moiety reagent; and (2) reaction of a drug moiety reagent with a linker reagent, to form drug-linker reagent D-L, via a covalent bond, followed by reaction with the nucleophilic of an antibody. Conjugation methods (1) and (2) may be employed with a variety of antibodies, and linkers to prepare the antibody-drug conjugates of the invention.

Nucleophilic groups on antibodies include, but are not limited to side chain thiol groups, e.g. cysteine. Thiol groups are nucleophilic and capable of reacting to form covalent bonds with electrophilic groups on linker moieties such as those of the present invention. Certain antibodies have reducible interchain disulfides, i.e. cysteine bridges. Antibodies may be made reactive for conjugation with linker reagents by treatment with a reducing agent such as DTT (Cleland's reagent, dithiothreitol) or TCEP (tris(2-carboxyethyl)phosphine hydrochloride; Getz et al (1999) Anal. Biochem. Vol 273:73-80; Soltec Ventures, Beverly, MA). Each cysteine disulfide bridge will thus form, theoretically, two reactive thiol nucleophiles. Additional nucleophilic groups can be introduced into antibodies through the reaction of lysines with 2-iminothiolane (Traut's reagent) resulting in conversion of an amine into a thiol.

The Subject/Patient

The subject/patient may be an animal, mammal, a placental mammal, a marsupial (e.g., kangaroo, wombat), a monotreme (e.g., duckbilled platypus), a rodent (e.g., a guinea pig, a hamster, a rat, a mouse), murine (e.g., a mouse), a lagomorph (e.g., a rabbit), avian (e.g., a bird), canine (e.g., a dog), feline (e.g., a cat), equine (e.g., a horse), porcine (e.g., a pig), ovine (e.g., a sheep), bovine (e.g., a cow), a primate, simian (e.g., a monkey or ape), a monkey (e.g., marmoset, baboon), an ape (e.g., gorilla, chimpanzee, orangutang, gibbon), or a human.

Furthermore, the subject/patient may be any of its forms of development, for example, a foetus. In one preferred embodiment, the subject/patient is a human.

In one embodiment, the patient is a population where each patient has a tumour having $\alpha_v\beta_5$ integrin on the surface of the cell.

Synthesis

One possible synthesis route to a dimer intermediate of formula IV is shown below:

86

Intermediate IV can be used to make intermediate VII

87

Intermediate IV can be used to make intermediate IX:

88

Alternatively, intermediate IV can be coupled with intermediate X to make intermediate IX:

89

+ XII

1. Deprotection

2.

90

Intermediate IV can be used to make intermediate XVI

One possible synthesis route to a dimer intermediate of formula XIV is shown below:

93

Intermediate XXI can be used to make intermediate XXVII:

In the above schemes, R^N , $R^{N'}$ and $R^{N''}$ each independently represent a nitrogen protecting group. R^C and $R^{C'}$ each independently represent OH or $OProt^O$, where $Prot^O$ is a hydroxy protecting group. Protecting groups are well known in the art. R^N , $R^{N'}$ and $R^{N''}$ may be, for example, BOC. $Prot^O$ may be THP. It may be the protection of the N10-C11 imine bonds is removed at a different stage in the synthesis methods to that shown above, dependent on the chemistries employed.

In general, the compounds and conjugates can be prepared by first linking two PBD monomers with a phenylene or pyridylene dimer bridge to produce intermediate IV or XXI. The halogen group on the aryl ring in the dimer bridge of intermediate IV may then be used

to form the tether (including linker group G or L) to connect the PBD dimer to the cell binding agent.

In more detail, two PBD monomers with $-XH$ and $-X'H$ groups at the C8 position of each PBD monomer (intermediates I and II, respectively) may be reacted with $-T-Hal$ and $-T'-Hal$ groups on intermediate III or intermediate XX. Such a method of synthesis allows for the PBD monomers to be different and so the resulting PBD dimer is asymmetrical. Equally, the PBD monomers may be the same.

PBD dimer intermediate IV may be used to provide the compounds and conjugates of the present invention by reacting the aryl halogen group in the bridge in a number of ways.

First, intermediate IV can be used in a Sonogishira cross-coupling reaction to provide an acetylene group on the aryl group of the dimer bridge. Sonogishira cross-coupling reactions are well known in the art for coupling a terminal alkyne with an aryl halide in the presence of a palladium catalyst, such as $Pd(Ph_3)_4$, a copper catalyst, such as CuI , and a base, such as diethylamine.

When acetylene is to be used as the terminal acetylene, one side of the acetylene molecule is typically protected with, for example, TMS in order to prevent cross-linking of the PBD dimers. Once the Sonogishira reaction is complete, the TMS group can be cleaved to provide alkyne intermediate V.

Intermediate V can be reacted with an azido compound to form a triazole derivative in an azide-alkyne Huisgen cycloaddition. Such a reaction may be catalysed by a copper catalyst. To form the compounds and conjugates of the present invention, the azide is bonded to an ethylene group and a variable number of PEG groups. The azide may be terminated with an amine group to react further. Reaction of intermediate V with an amino-azide compound will provide intermediate VI.

The free amine group of intermediate VI can then be reacted with a carboxylic acid group of a linker group for connecting to a cell binding unit to form the amido group linking the PBD dimer to the linker group G or L to provide compound VII.

The linker/reactive group, G, of intermediate VII can be conjugated to a cell binding agent to provide conjugates of the present invention.

As an alternative Sonogishira reaction, intermediate IV can be coupled to an acetylamine, such as propargylamine in the presence of palladium and copper catalysts and base. Such a reaction provides part of a tether attached to the PBD dimer bridge where the alkyne group is preserved and a free terminal amine is available for further reaction. For example, the reaction of intermediate IV with propargylamine provides intermediate VIII.

The terminal amine of intermediate VIII can be reacted with, for example, a carboxylic acid group attached to a linker/reactive group G (for connecting to a cell binding agent) to provide intermediate IX.

As an alternative synthesis of intermediate IX, the carboxylic acid group of intermediate XI can be reacted with propargylamine to form intermediate XII. Reaction of intermediate IV with intermediate XII in a Sonogoshira reaction yields intermediate XIII.

The protected amine group terminated the variable PEG chain can be deprotected and reacted with the carboxylic acid group of intermediate XIV in order to couple the linker/reactive group G onto the PBD dimer and produce intermediate XIV.

Intermediate IV may also be used in a cross-coupling amination reaction, such as a Buchwald-Hartwig amination. A carbon-nitrogen bond is formed via a palladium-catalysed cross-coupling of an amine with an aryl halide. A number of palladium catalysts for use in such cross-coupling reactions are known, such as $\text{Pd}(\text{Ph}_3)_4$ or RuPhos/RuPhosPd.

Reaction of intermediate IV with a piperazine functionalised with a protected propan-1-amine provides intermediate XV. The protected amine of intermediate XV can be further reacted with, for example, a carboxylic acid group attached to a linker/reactive group, G, for connecting to a cell binding agent to provide intermediate XVI.

Cross-coupling amination reaction, such as a Buchwald-Hartwig amination, of intermediate IV with a partially protected piperazine followed by deprotection (for example with trifluoroacetic acid) provides intermediate XVII.

The deprotected piperazine amine group of intermediate XVII can be reacted with a carboxylic acid group in intermediate XVIII to provide intermediate XIX.

Intermediate XXI can be used to form the oxime intermediate XXIV. For example, a partially protected PEG-diamine, intermediate XXII, may be reacted with the carboxylic acid group of intermediate XIV. Deprotection yields intermediate XIII.

Reaction of intermediates XXI and XXIII yields oxime intermediate XXIV. The syn and anti oximes can be resolved using preparative HPLC.

Intermediate XXI can also be used to form the acrylamide intermediate XXVII. For example, the aldehyde intermediate XXI can be reacted with malonic acid in a Knoevenagel condensation to yield the acrylic acid intermediate XXV. This can be reacted with a partially protected PEG-diamine to yield intermediate XXVI. Deprotection and coupling with intermediate XIV yield the acrylamide intermediate XXVII.

The synthesis of PBD compounds containing two imine moieties is extensively discussed in the following references, which discussions are incorporated herein by reference:

Examples

General Experimental Methods

Optical rotations were measured on an ADP 220 polarimeter (Bellingham Stanley Ltd.) and concentrations (*c*) are given in g/100mL. Melting points were measured using a digital melting point apparatus (Electrothermal). IR spectra were recorded on a Perkin-Elmer Spectrum 1000 FT IR Spectrometer. ¹H and ¹³C NMR spectra were acquired at 300 K using a Bruker Avance NMR spectrometer at 400 and 100 MHz, respectively. Chemical shifts are reported relative to TMS ($\delta = 0.0$ ppm), and signals are designated as s (singlet), d (doublet), t (triplet), dt (doublet triplet), dd (doublet of doublets), ddd (doublet of doublets of doublets) or m (multiplet), with coupling constants given in Hertz (Hz). Mass spectroscopy (MS) data were collected using a Waters Micromass ZQ instrument coupled to a Waters 2695 HPLC with a Waters 2996 PDA. Waters Micromass ZQ parameters used were: Capillary (kV), 3.38; Cone (V), 35; Extractor (V), 3.0; Source temperature ($^{\circ}$ C), 100; Desolvation Temperature ($^{\circ}$ C), 200; Cone flow rate (L/h), 50; De-solvation flow rate (L/h), 250. High-resolution mass spectroscopy (HRMS) data were recorded on a Waters Micromass QTOF Global in positive

W-mode using metal-coated borosilicate glass tips to introduce the samples into the instrument. Thin Layer Chromatography (TLC) was performed on silica gel aluminium plates (Merck 60, F₂₅₄), and flash chromatography utilised silica gel (Merck 60, 230-400 mesh ASTM). All chemicals and solvents were purchased from Sigma-Aldrich and were used as supplied without further purification.

General LC/MS conditions: The HPLC (Waters Alliance 2695) was run using a mobile phase of water (A) (formic acid 0.1%) and acetonitrile (B) (formic acid 0.1%). Gradient: initial composition 5% B over 1.0 min then 5% B to 95% B within 3 min. The composition was held for 0.5 min at 95% B, and then returned to 5% B in 0.3 minutes. Total gradient run time equals 5 min. Flow rate 3.0 mL/min, 400 μ L was split *via* a zero dead volume tee piece which passes into the mass spectrometer. Wavelength detection range: 220 to 400 nm. Function type: diode array (535 scans). Column: Phenomenex[®] Onyx Monolithic C18 50 x 4.60 mm.

The analytical LC/MS conditions for Example 5 to 11 were as follows: Positive mode electrospray mass spectrometry was performed using a Shimadzu Nexera[®]/Prominence[®] LCMS-2020. Mobile phases used were solvent A (H₂O with 0.1% formic acid) and solvent B (CH₃CN with 0.1% formic acid). Gradient: Initial composition 5% B held over 0.25 min, then increased from 5% B to 100% B over a 2 min period. The composition was held for 0.50 min at 100% B, then returned to 5% B in 0.05 min and held there for 0.05 min. The total duration of the gradient run was 3.0 min. Flow rate was 0.8 mL/min. Detection was at 214 and 254 nm. Column: Waters Acquity UPLC[®] BEH Shield RP18 1.7 μ m 2.1 x 50 mm at 50 °C.

The preparative HPLC conditions for Example 5 to 11 were as follows: Reverse-phase ultra-fast high-performance liquid chromatography (UFLC) was carried out on a Shimadzu Prominence[®] machine using Phenomenex[®] Gemini NX 5 μ C18 columns (at 50 °C) of the following dimensions: 150 x 4.6 mm for analysis, and 150 x 21.2 mm for preparative work. Eluents used were solvent A (H₂O with 0.1% formic acid) and solvent B (CH₃CN with 0.1% formic acid). All UFLC experiments were performed with gradient conditions: From 0 to 30 min the composition of B was increased from 0 to 100% and held at 100% B for a further 2 min. The composition of B was decreased from 100% to 0% from 32.0 min to 32.1 min and held at 0% B until 35.0 min. The total duration of the gradient run was 35.0 min. Flow rates used were 1.0 mL/min for analytical, and 20.0 mL/min for preparative HPLC. Detection was at 254 and 280 nm.

Example 1

(a) (11*S*,11*aS*,11'*S*,11*a'S*)-*di-tert-butyl* 8,8'-(((5-halo-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**2a**, **2b**, **2c**)

(i) (11*S*,11*aS*,11'*S*,11*a'S*)-*di-tert-butyl* 8,8'-(((5-iodo-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**2a**).

1,3-bis(bromomethyl)-5-iodobenzene (2.00 g, 5.20 mmol) was added to a stirred solution of Boc/THP-protected PBD capping unit **1** (4.75 g, 10.3 mmol), TBAI (190 mg, 0.52 mmol) and K₂CO₃ (1.42 g, 10.3 mmol) in dry DMF (60 mL). The reaction mixture was heated to 60 °C and stirred under an argon atmosphere for 3 hours at which point analysis by LC/MS revealed substantial product formation at retention time 4.15 min (ES+) *m/z* 1171 ([*M*+ Na]⁺; ~10% relative intensity). The reaction mixture was allowed to cool to room temperature and the DMF was removed by evaporation *in vacuo*. The resulting residue was partitioned between water (50 mL) and EtOAc (50 mL) and the aqueous phase was extracted with EtOAc (3 x 20 mL). The combined organic layers were washed with water (2 x 20 mL), brine (50 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 50:50 v/v EtOAc/hexane to 80:20 v/v EtOAc/hexane) gave the bis-ether **2a** as a white foam (5.42 g, 91% yield).

(ii) (11*S*,11*aS*,11'*S*,11*a'S*)-*di-tert-butyl* 8,8'-(((5-bromo-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**2b**)

1-bromo-3,5-bis(bromomethyl)benzene (1.54 g, 4.53 mmol) was added to a stirred solution of Boc/THP-protected PBD capping unit **1** (4.20 g, 9.06 mmol), TBAI (167 mg, 0.45 mmol) and K₂CO₃ (1.25 g, 9.06 mmol) in dry DMF (52 mL). The reaction mixture was heated to 60 °C and stirred under an argon atmosphere for 5 hours at which point analysis by LC/MS

revealed substantial product formation at retention time 4.10 min (ES+) m/z 1101 ($[M+H]^+$, ~70% relative intensity). The reaction mixture was allowed to cool to room temperature and the DMF was removed by evaporation *in vacuo*. The resulting residue was partitioned between water (60 mL) and EtOAc (60 mL) and the aqueous phase was extracted with EtOAc (3 x 25 mL). The combined organic layers were washed with water (30 mL), brine (50 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 50:50 v/v EtOAc/hexane to 100% EtOAc) gave the bis-ether **2b** as a white foam (3.37 g, 68% yield).

(iii) (11*S*, 11*aS*, 11'*S*, 11*a'S*)-di-*tert*-butyl 8,8'-(((5-chloro-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**2c**)

1,3-bis(bromomethyl)-5-chlorobenzene (1.42 g, 4.80 mmol) was added to a stirred solution of Boc/THP-protected PBD capping unit **1** (4.42 g, 9.60 mmol), TBAI (177 mg, 0.48 mmol) and K_2CO_3 (1.33 g, 9.60 mmol) in dry DMF (55 mL). The reaction mixture was heated to 60 °C and stirred under an argon atmosphere for 1.5 hours at which point analysis by LC/MS revealed substantial product formation at retention time 4.08 min (ES+) m/z 1057 ($[M+H]^+$, ~30% relative intensity). The reaction mixture was allowed to cool to room temperature and the DMF was removed by evaporation *in vacuo*. The resulting residue was partitioned between water (60 mL) and EtOAc (60 mL) and the aqueous phase was extracted with EtOAc (3 x 20 mL). The combined organic layers were washed with water (20 mL), brine (40 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 50:50 v/v EtOAc/hexane to 80:20 v/v EtOAc/hexane) gave the bis-ether **2c** as a white foam (5.10 g, 99% yield).

(b) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-ethynyl-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4] benzodiazepine-10(5*H*)-carboxylate) (4)

(i) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-((trimethylsilyl)ethynyl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (3)

A catalytic amount of Pd(PPh₃)₄ (15.0 mg, 13.1 μmol) was added to a mixture of the bis-ether 2a (750 mg, 0.65 mmol), TMS-acetylene (278 μL, 191 mg, 1.96 mmol), CuI (5.0 mg, 26.1 μmol), diethylamine (1.35 mL, 956 mg, 13.1 mmol) and oven-dried 4 Å molecular sieve pellets in dry DMF (5.6 mL) in an oven-dried sealable vessel. The mixture was degassed and flushed with argon 3 times then heated in a microwave at 100 °C for 30 minutes at which point analysis by LC/MS revealed complete consumption of starting material and substantial product formation at retention time 4.37 min (ES+) *m/z* 1142 ([*M*+ Na]⁺; ~40% relative intensity). Peak at retention time 3.97 min (ES+) *m/z* 1069 ([*M*+ Na]⁺; ~60% relative intensity) observed which corresponds to TMS-cleavage under LC/MS conditions. The reaction mixture was allowed to cool to room temperature and was then filtered through a sinter to remove the sieves (washed with DMF). The filtrate was evaporated *in vacuo* and the resulting residue subjected to flash chromatography (gradient elution: 50:50 v/v EtOAc/hexane to 80:20 v/v EtOAc/hexane) to provide the TMS-acetylene 3 as a yellow foam (691 mg, 95% yield).

(ii) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-ethynyl-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4] benzodiazepine-10(5*H*)-carboxylate) (4)

Solid K₂CO₃ (383 mg, 2.77 mmol) was added to a stirred solution of the TMS-protected compound 3 (1.55 g, 1.39 mmol) in MeOH (20 mL). After 3 hours stirring at room temperature the reaction was deemed to be complete as judged by LC/MS [desired product

peak at retention time 4.00 min (ES+) m/z 1047 ($[M+H]^+$, ~30% relative intensity)]. The MeOH was removed by evaporation *in vacuo* and the resulting residue was partitioned between water (60 mL) and EtOAc (60 mL). The layers were separated and the aqueous phase was extracted with EtOAc (3 x 20 mL). The combined organic layers were washed with water (30 mL), brine (30 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 50:50 v/v EtOAc/hexane to 80:20 v/v EtOAc/hexane) gave the acetylene **4** as an orange foam (1.13 g, 78% yield).

(c) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-(1-(2-(2-(2-(2-aminoethoxy)ethoxy)ethoxy)ethyl)-1*H*-1,2,3-triazol-4-yl)-1,3-phenylene)bis(methylene))bis(oxy)))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**5**)

Solid $CuSO_4 \cdot 5H_2O$ (13.0 mg, 52.0 μ mol) and (+)-sodium *L*-ascorbate (41.0 mg, 0.21 mmol) were added to a stirred solution of 11-Azido-3,6,9-trioxaundecan-1-amine (227 mg, 207 μ L, 1.04 mmol) and the alkyne **4** (1.09 g, 1.04 mmol) in *tert*-BuOH (6 mL) and H_2O (6 mL) at room temperature. A colour change from yellow to green was observed as the reaction progressed. After stirring for 16 hours analysis by LC/MS revealed a substantial amount of desired product formed corresponding to peak at retention time 3.12 min (ES+) m/z 1265 ($[M+H]^+$, ~100% relative intensity). [NOTE: On some occasions reaction progress stalled, however, the reaction was driven to completion upon addition of further $CuSO_4 \cdot 5H_2O$ (0.05 equivalents) and (+)-sodium *L*-ascorbate (0.2 equivalents)]. The reaction mixture was partitioned (without shaking of the separating funnel) between water (50 mL) and EtOAc (50 mL). The aqueous phase was extracted with EtOAc (3 x 15 mL) and the combined organic layers were washed with water (30 mL), brine (50 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to provide the crude product **5** as a green foam (1.32 g, 100% crude yield). The crude product was carried through to next step without further purification.

(d) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-(1-(18-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)-13-oxo-3,6,9-trioxa-12-azaocetadecyl)-1*H*-1,2,3-triazol-4-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**6**)

Solid 6-maleimidohexanoic acid *N*-hydroxysuccinimide ester (327 mg, 1.06 mmol) was added to a stirred solution of the primary amine **5** (1.28 g, 1.01 mmol) in dry DCM (30 mL) at room temperature. Progress was monitored by LC/MS and after 3 days stirring the reaction proceeded no further, a substantial amount of desired product was observed at retention time 3.65 min (ES+) *m/z* 1458 ($[M+H]^+$, ~100% relative intensity) accompanied by unreacted starting material at retention time 3.15 min. The reaction mixture was treated with silica gel and the solvent removed by evaporation *in vacuo*. The resulting residue was subjected to flash chromatography (gradient elution: 100% DCM to 97:3 v/v DCM/MeOH) to give the maleimide **6** as a foam (658 mg, 45% yield).

(e) *N*-(2-(2-(2-(2-(4-(3,5-bis((((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-1*H*-1,2,3-triazol-1-yl)ethoxy)ethoxy)ethoxy)ethyl)-6-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)hexanamide (**7**).

A solution of 95:5 v/v TFA/H₂O (5 mL) was added to a sample of the Boc/THP-protected compound **6** (428 mg, 0.29 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1 hour the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 2.72 min (ES+) *m/z* 1054 ($[M+H]^+$, ~70% relative intensity). The reaction mixture was kept

cold and added drop wise to a chilled saturated aqueous solution of NaHCO_3 (100 mL). The mixture was extracted with DCM (3 x 30 mL) and the combined organic layers washed with H_2O (20 mL), brine (40 mL), dried (MgSO_4), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl_3 to 96:4 v/v $\text{CHCl}_3/\text{MeOH}$) gave **7** as an orange foam (163 mg, 53% yield).

Example 2

(a) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-(3-aminoprop-1-yn-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**8**)

A catalytic amount of $\text{Pd}(\text{PPh}_3)_4$ (5.0 mg, 4.2 μmol) was added to a mixture of the bis-ether **2a** (242 mg, 0.21 mmol), propargylamine (41 μL , 35 mg, 0.63 mmol), CuI (1.6 mg, 8.4 μmol), diethylamine (0.42 mL, 309 mg, 4.22 mmol) and oven-dried 4Å molecular sieve pellets in dry DMF (1.8 mL) in an oven-dried sealable vessel. The mixture was degased and flushed with argon 3 times then heated in a microwave at 100 °C for 3 minutes at which point analysis by LC/MS revealed complete consumption of starting material and substantial product formation at retention time 3.18 min (ES+) m/z 1076 ($[M+H]^+$, ~60% relative intensity). The reaction mixture was allowed to cool to room temperature and was then filtered through a sinter to remove the sieves (washed with DMF). The filtrate was evaporated *in vacuo* to provide the unstable crude product **8** which was used immediately in the next step without purification or analysis.

(b) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-(1-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)-3,19-dioxo-7,10,13,16-tetraoxa-4,20-diazatricos-22-yn-23-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4] benzodiazepine-10(5*H*)-carboxylate) (**9**)

MAL-dPEG[®]4-acid (88 mg, 0.21 mmol) was added to a stirred solution of EDCI (41 mg, 0.21 mmol) and the crude primary amine **8** in dry DCM (4 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 3 hours at which point analysis by LC/MS showed a substantial amount of desired product at retention time 3.58 min (ES+) m/z 1475 ($[M+H]^+$, ~10% relative intensity), 1498 ($[M+Na]^+$, ~5% relative intensity) accompanied by a side product at retention time 3.85 min. The reaction mixture was diluted with DCM (30 mL) and washed with H₂O (3 x 10 mL), brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% DCM to 96:4 v/v DCM/MeOH) gave the maleimide **9** as a foam (67 mg, 22% yield over 2 steps).

(c) *N*-(3-(3,5-bis((((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4] benzodiazepin-8-yl)oxy)methyl)phenyl)prop-2-yn-1-yl)-1-(3-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)propanamido)-3,6,9,12-tetraoxapentadecan-15-amide (**10**)

A solution of 95:5 v/v TFA/H₂O (1 mL) was added to a sample of the Boc/THP-protected compound **9** (67 mg, 45.5 μ mol) at 0 °C (ice/acetone). After stirring at 0 °C for 1.5 hours, the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 2.67 min (ES+) m/z 1070 ($[M+H]^+$, ~5% relative intensity). The reaction mixture was kept cold and added drop wise to a chilled saturated aqueous solution of NaHCO₃ (50 mL). The mixture was extracted with DCM (3 x 15 mL) and the combined organic layers washed with brine (40 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl₃ to 96:4 v/v CHCl₃/MeOH) gave **10** as an orange foam (12 mg, 24% yield).

Example 3

(a) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-(4-(3-((*tert*-butoxycarbonyl)amino)propyl)piperazin-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**11**)

A sample of the bis-ether **2c** (250 mg, 0.24 mmol), NaO^tBu (57 mg, 0.59 mmol), RuPhos (11 mg, 23.7 μmol) and RuPhosPd (19 mg, 23.7 μmol) were added to an oven-dried sealable tube (which was allowed to cool in a desiccator). The mixture was degassed and flushed with argon 3 times before the addition of dry THF (5 mL) and then allowed to stir under an inert atmosphere for ~10 minutes until the red colour had discharged. A solution of 3-(piperazin-1-yl)propan-1-amine (58 mg, 0.26 mmol) in dry THF (1 mL) was added and the mixture again degassed and flushed with argon 3 times. The reaction mixture was heated at 80 °C in a pre-heated oil bath for 2.5 hours at which point analysis by LC/MS revealed a 3-component mixture: desired product at retention time 3.35 min (ES+) *m/z* 1264 ([*M*+ H]⁺, ~60% relative intensity), major side product at retention time 3.95 min (de-chlorinated analogue of **2c**) and shoulder 4.13 min (trace starting material). After being allowed to cool to room temperature the reaction mixture was partitioned between water (20 mL) and EtOAc (20 mL). The aqueous phase was extracted with EtOAc (3 x 15 mL) and the combined organic layers were washed with water (30 mL), brine (50 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% DCM to 95:5 v/v DCM/MeOH) gave the piperazine **11** as a foam (152 mg, 25% yield).

(b) (11a*S*,11a'*S*)-8,8'-(((5-(4-(3-aminopropyl)piperazin-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-2,3-dihydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-5(11a*H*)-one) (12)

A solution of 95:5 v/v TFA/H₂O (2 mL) was added to a sample of the Boc/THP-protected compound **11** (142 mg, 0.11 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1 hour, the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 2.23 min (ES+) *m/z* 778 ([*M*+ H₂O]⁺, ~5% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO₃ (50 mL). The mixture was extracted with DCM (3 x 20 mL) and the combined organic layers washed with brine (15 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product **12** as a waxy solid (22.6 mg). Note that during the NaHCO₃ neutralisation step the desired product precipitated out of solution as a waxy solid which was only partially soluble in DCM. Additional product was obtained by dissolving DCM-insoluble solids in DMF followed by evaporation *in vacuo*. The resulting oily residue was triturated with diethylether to provide a solid which was dried *in vacuo* to provide additional crude **12** (54.4 mg, total amount = 77 mg, 85% yield) which was carried through to the next step without further purification or analysis.

(c) *N*-(3-(4-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)piperazin-1-yl)propyl)-1-(3-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)propanamido)-3,6,9,12-tetraoxapentadecan-15-amide (13).

MAL-dPEG@4-acid (42 mg, 0.10 mmol) was added to a stirred solution of EDCI (20 mg, 0.10 mmol) and the crude primary amine **12** (77 mg, 0.10 mmol) in dry DCM (4 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 3 hours at which point analysis by LC/MS showed complete consumption of starting material, a substantial amount of desired product at retention time 2.42 min (ES+) m/z 1176 ($[M+H_2O]^+$, ~5% relative intensity) and excess MAL-dPEG@4-acid at retention time 2.05 min (weak signal on diode array but detectable on ES+/ES-). The reaction mixture was diluted with DCM (30 mL) and washed with H₂O (15 mL), brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl₃ to 93:7 v/v CHCl₃/MeOH) gave the maleimide **13** as a foam (46 mg, 55%). Note that trace amounts of excess MAL-dPEG@4-acid could not be removed using flash chromatography.

Example 4

(a) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-(4-(*tert*-butoxycarbonyl)piperazin-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**14**)

2-Dicyclohexylphosphino-2',6'-diisopropoxybiphenyl (18 mg, 38 μ mol, 0.2 eq), chloro(2-dicyclohexylphosphino-2',6'-diisopropoxy-1,1'-biphenyl)[2-(2'-amino-1,1'-biphenyl)]palladium(II) (18 mg, 22 μ mol, 0.12 eq), caesium carbonate (0.36 g, 1.1 mmol, 5.0 eq) and iodo derivative (**2a**) (0.307 g, 0.27 mmol, 1.0 eq) were placed in a microwave vial which was evacuated and flushed with Argon (x 3). Anhydrous THF (5 mL) was added followed by *tert*-butyl piperazine-1-carboxylate (70 mg, 0.37 mmol, 1.1 eq) and the resultant mixture was heated at 85°C for 4h then overnight at room temperature. The reaction mixture was diluted with saturated sodium hydrogen carbonate and extracted with ethylacetate (3 x 100 mL). The combined ethylacetate extracts were washed with brine (100 mL), dried (MgSO₄) and evaporated under reduced pressure. The product **14** was purified by flash column chromatography [CHCl₃/MeOH 0% to 1.5% in 0.5% increments] (0.111 g, 51%)

Analytical Data: RT 4.12 min; MS (ES⁺) *m/z* (relative intensity) 1207 ([*M* + 1]⁺, 30).

(b) (11a*S*, 11a'*S*)-8,8'-(((5-(piperazin-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-2,3-dihydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-5(11a*H*)-one) (15)

A cold (ice bath) solution of 95% trifluoroacetic acid (4 mL) was added to compound (14) (0.2 g, 0.165 mmol, 1 eq.) which had been cooled in an ice bath. The solution was stirred at 0°C for 30 min when reaction was shown to be complete by LCMS. The reaction mixture was added drop-wise to a mixture of ice and saturated sodium bicarbonate solution to neutralise the trifluoroacetic acid. The mixture was extracted with DCM (4 x 75 mL) and the combined extracts were washed with water (100 mL) saturated brine (100 mL), dried (MgSO₄) and evaporated under reduced pressure to give the product 15 as a yellow solid which was used without further purification (0.116 g, 100%)

Analytical Data: RT 2.33 min; MS (ES⁺) *m/z* (relative intensity) 703 ([*M* + 1]⁺, 100).

(c) *N*-(15-(4-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)piperazin-1-yl)-15-oxo-3,6,9,12-tetraoxapentadecyl)-3-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)propanamide (17)

N-(3-Dimethylaminopropyl)-*N'*-ethylcarbodiimide hydrochloride (35 mg, 0.18 mmol, 1.1 eq) was added to a solution of compound (15) (116 mg, 0.165 mmol, 1.0 eq) and 1-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)-3-oxo-7,10,13,16-tetraoxa-4-azanonadecan-19-oic acid (16) (69 mg, 0.165 mmol, 1.0 eq) in anhydrous DCM (5 mL) under Argon. The resultant solution was stirred at room temperature for 2h. The reaction mixture was diluted with DCM (50 mL), washed with water (100 mL), saturated sodium hydrogen carbonate solution (100 mL), water (100 mL), brine (100 mL), dried (MgSO₄) and evaporated under reduced pressure.

Purification by flash column chromatography [$\text{CHCl}_3/\text{MeOH}$ 0% to 5% in 1% increments] gave the product **17** as a yellow glass (0.058 g, 32%)

Analytical Data: $[\alpha]_D^{18} = +628^\circ$ ($c = 0.25$, CHCl_3); RT 2.65 min; MS (ES^+) m/z (relative intensity) 1101 ($[M + 1]^+$; 40)

Example 5

(a) *tert*-butyl (42-(2,5-dioxo-2,5-dihydro-1H-pyrrol-1-yl)-37-oxo-3,6,9,12,15,18,21,24,27,30,33-undecaoxa-36-azadotetracontyl)oxycarbamate (**19**)

6-Maleimidohexanoic acid (64 mg, 0.30 mmol) was added to a stirred solution of EDCI (64 mg, 0.33 mmol) and the primary amine **18** (200 mg, 0.30 mmol) in dry DCM (6 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 16 hours at which point analysis by LC/MS showed a substantial amount of desired product at retention time 1.38 min $\{(\text{ES}^+) m/z 854 ([M + H]^+, \sim 30\% \text{ relative intensity}), 877 ([M + \text{Na}]^+, \sim 100\% \text{ relative intensity})\}$ accompanied by unreacted **18** at retention time 1.07 min, note that both starting material and product had weak UV absorption (214 and 254 nm) and were best detected on ES^+ TIC. Additional 6-maleimidohexanoic acid (32 mg, 0.15 mmol) and EDCI (32 mg, 0.17 mmol) were added to the stirred mixture until starting material was completely consumed (as judged by LC/MS). The reaction mixture was diluted with DCM (100 mL) and washed with H_2O (3 x 30 mL), brine (40 mL), dried (MgSO_4), filtered and evaporated in vacuo to provide the crude product. Purification by flash chromatography (gradient elution in 1% increments: 100% DCM to 96:4 v/v DCM/MeOH) gave the amide **19** as an oil (214 mg, 83% yield).

(b) *N*-(35-(aminooxy)-3,6,9,12,15,18,21,24,27,30,33-undeca-oxapentatriacontyl)-6-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)hexanamide (**20**)

A solution of 95:5 v/v TFA/H₂O (2 mL) was added to a sample of the Boc/THP-protected compound **19** (214 mg, 0.25 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1 hour the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 1.06 min {(ES⁺) m/z 754 ([M+ H]⁺, ~100% relative intensity)}, note that both starting material and product had weak UV absorption (214 and 254 nm) and were best detected on ES⁺ TIC. The reaction mixture was kept cold and added drop wise to a chilled saturated aqueous solution of NaHCO₃ (100 mL). The mixture was extracted with DCM (3 x 30 mL) and the combined organic layers washed with brine (50 mL), dried (MgSO₄), filtered and evaporated in vacuo to provide the oxyamine **20** as an oil (161 mg, 85% yield) which was carried through to the next step without further purification.

(c) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-formyl-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**21**)

3,5-bis(bromomethyl)benzaldehyde (260 mg, 0.90 mmol) [Enrique Díez-Barra et al J. Org. Chem. 2001, **66**, 5664–5670] was added to a stirred solution of Boc/THP-protected PBD capping unit **7** (826 mg, 1.79 mmol), TBAI (33 mg, 89.7 μmol) and K₂CO₃ (247 mg, 1.79 mmol) in dry DMF (12 mL). The reaction mixture was heated to 60 °C and stirred under an argon atmosphere for 2.5 hours at which point analysis by LC/MS revealed substantial product formation at retention time 1.92 min {(ES⁺) m/z 1051 ([M+ H]⁺, ~65% relative

intensity) 1073 ($[M+ Na]^+$, ~25% relative intensity)}. The reaction mixture was allowed to cool to room temperature and the DMF was removed by evaporation *in vacuo*. The resulting residue was partitioned between water (50 mL) and EtOAc (50 mL) and the aqueous phase was extracted with EtOAc (3 x 15 mL). The combined organic layers were washed with water (2 x 20 mL), brine (30 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution in 10% increments: 50:50 v/v EtOAc/hexane to 80:20 v/v EtOAc/hexane) gave the bis-ether **21** as a white foam (717 mg, 76% yield). Note that **21** was isolated as a mixture of diastereoisomers arising from THP protecting group.

(d) (11*S*,11*aS*,11'*S*,11*a'S*)-di-*tert*-butyl 8,8'-(((5-((*syn/anti*)-45-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)-40-oxo-3,6,9,12,15,18,21,24,27,30,33,36-dodecaoxa-2,39-diazapentatetracont-1-en-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2*H*-pyran-2-yl)oxy)-2,3,11,11*a*-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepine-10(5*H*)-carboxylate) (**22**)

PTSA (4.1 mg, 21.4 μ mol) was added to a stirred solution of the aldehyde **21** (224 mg, 0.21 mmol) and the oxy-amine **20** (161 mg, 0.21 mmol) in dry DCM (3 mL) at 0 °C (ice/acetone). The reaction mixture was allowed to stir at 0 °C under an argon atmosphere and stirring for 3 hours analysis by LC/MS revealed complete consumption of oxyamine **20** (retention time 1.06 min), presence of desired product {retention time 1.85 min (ES^+) m/z 1787 ($[M+ H]^+$, ~25% relative intensity) 1810 ($[M+ Na]^+$, ~90% relative intensity)} and unreacted aldehyde **21** (retention time 1.91 min). In order to avoid unwanted THP cleavage (observed in earlier test reactions), the reaction was quenched at this point although aldehyde had not been completely consumed: The mixture was diluted with DCM (50 mL) and washed with $NaHCO_3$ (3 x 15 mL), brine (30 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to provide the

crude product. Purification by flash chromatography (gradient elution in 1% increments: 100% DCM to 96:4 v/v DCM/MeOH) gave the *syn/anti* oximes **22** as a white foam (215 mg, 56% yield). Unreacted aldehyde **21** (83 mg) was recovered during flash chromatography. Note that **22** was isolated as a mixture of diastereoisomers arising from THP protecting group.

(e) *N*-((*syn/anti*)-1-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-3,6,9,12,15,18,21,24,27,30,33,36-dodecaoxa-2-azaoctriacont-1-en-38-yl)-6-(2,5-dioxo-2,5-dihydro-1H-pyrrol-1-yl)hexanamide (**23**)

A solution of 95:5 v/v TFA/H₂O (1 mL) was added to a sample of the Boc/THP-protected compound **22** (204 mg, 0.11 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 30 minutes, the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 1.42 min {(ES⁺) m/z 1383 ([M+ H]⁺, <5% relative intensity)}. The reaction mixture was kept cold and added drop wise to a chilled saturated aqueous solution of NaHCO₃ (50 mL). The mixture was extracted with DCM (3 x 15 mL) and the combined organic layers washed with brine (30 mL), dried (MgSO₄), filtered and evaporated in vacuo to provide the crude product. Purification by flash chromatography (gradient elution in 1% increments: 100% CHCl₃ to 96:4 v/v CHCl₃/MeOH) gave the deprotected *syn/anti* oximes **23** as a yellow thin film (85 mg, 54% yield). Analysis by reverse-phase ultra-high-performance liquid chromatography (see General Information section for conditions) revealed predominantly two peaks at 16.15 min (*syn* isomer, minor component) and 16.42 min (*anti* isomer, major component).

(f) *N*-((anti)-1-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-3,6,9,12,15,18,21,24,27,30,33,36-dodecaoxa-2-azaooctatriacont-1-en-38-yl)-6-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)hexanamide (**24**)

Compound **23** was subjected to purification by preparative HPLC (see general information section for conditions). The peak eluting at a retention time of 16.42 min was isolated and lyophilised to provide the *anti*-oxime **24** (9.9 mg): ^1H NMR (400 MHz, CDCl_3) δ 8.12 (s, 1H), 7.66 (d, 2H, $J = 4.4$ Hz), 7.62–7.59 (m, 2H), 7.53–7.51 (m, 3H), 6.82 (s, 2H), 6.68 (s, 2H), 6.16 (br s, 2H), 5.25–5.14 (m, 8H), 4.33 (t, 2H, $J = 4.8$ Hz), 4.28 (br s, 4H), 3.96 (s, 6H), 3.90–3.84 (m, 2H), 3.82–3.78 (m, 2H), 3.67–3.49 (m, 43H), 3.46–3.42 (m, 2H), 3.15–3.08 (m, 2H), 2.98–2.90 (m, 2H), 2.16 (t, 2H, $J = 7.6$ Hz), 1.70–1.54 (m, 4H), 1.36–1.24 (m, 2H).

(g) *N*-((syn)-1-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-3,6,9,12,15,18,21,24,27,30,33,36-dodecaoxa-2-azaooctatriacont-1-en-38-yl)-6-(2,5-dioxo-2,5-dihydro-1*H*-pyrrol-1-yl)hexanamide (**25**)

Compound **23** was subjected to purification by preparative HPLC (see general information section for conditions). The peak eluting at a retention time of 16.15 min was isolated and lyophilised to provide the *syn*-oxime **25** (5.2 mg): ^1H NMR (400 MHz, CDCl_3) δ 7.93–7.91 (m, 2H), 7.66 (d, 2H, $J = 4.4$ Hz), 7.57–7.55 (m, 1H), 7.52 (s, 2H), 7.32 (s, 1H), 6.82 (s, 2H), 6.68 (s, 2H), 6.18 (br s, 2H), 5.26–5.14 (m, 8H), 4.35 (t, 2H, $J = 5.1$ Hz), 4.28 (br s, 4H), 3.96 (s, 6H), 3.90–3.84 (m, 2H), 3.81 (t, 2H, $J = 5.1$ Hz), 3.68–3.48 (m, 43H), 3.46–3.42 (m, 2H), 3.15–3.07 (m, 2H), 2.97–2.90 (m, 2H), 2.16 (t, 2H, $J = 7.6$ Hz), 1.70–1.54 (m, 4H), 1.36–1.24 (m, 2H).

Example 6

(a) *Di-tert-butyl 8,8'-(((5-(1-amino-15-oxo-3,6,9,12-tetraoxa-16-azanonadec-18-yn-19-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate) (29)*

(i) *tert-Butyl (15-oxo-3,6,9,12-tetraoxa-16-azanonadec-18-yn-1-yl)carbamate (27)*

EDCI (263 mg, 1.37 mmol) was added to a stirred solution of *t*-boc-*N*-amido-dPEG₄-acid (26) (500 mg, 1.37 mmol, Stratech Scientific Limited) and propargylamine (88 μ L, 76 mg, 1.37 mmol) in dry DCM (10 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 16 hours at which point analysis by LC/MS showed a substantial amount of desired product at retention time 1.26 minutes (ES+) *m/z* 403 ($[M+H]^+$, ~50% relative intensity), 425 ($[M+Na]^+$, ~100% relative intensity), note that both starting material and product had weak UV absorption (214 and 254 nm) and were best detected on ES+ TIC. The reaction mixture was diluted with DCM (100 mL) and washed with H₂O (30 mL), brine (40 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution in 1% increments: 100% DCM to 98:2 v/v DCM/MeOH) gave the amide 27 as an oil (392 mg, 71% yield).

(ii) *Di-tert-butyl 8,8'-(((5-(2,2-dimethyl-4,20-dioxo-3,8,11,14,17-pentaoxa-5,21-diazatetracos-23-yn-24-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-*

methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate (**28**)

A catalytic amount of Pd(PPh₃)₄ (23.0 mg, 19.5 μmol) was added to a mixture of the iodoaryl compound **2a** (1.02 g, 0.89 mmol), Boc-acetylene **27** (393 mg, 0.98 mmol), CuI (7.4 mg, 39.1 μmol), diethylamine (2.02 mL, 1.43 g, 19.5 mmol) and oven-dried 4Å molecular sieve pellets in dry DMF (9 mL) in an oven-dried sealable vessel. The mixture was degassed and flushed with argon 3 times then heated in a microwave at 100 °C for 26 minutes at which point analysis by LC/MS revealed substantial product formation at retention time 1.89 minutes (ES+) *m/z* 1446 ([M+ Na]⁺, ~100% relative intensity, 1424 ([M+ H]⁺, ~15% relative intensity). The reaction mixture was allowed to cool to room temperature and was then filtered through a sinter to remove the sieves (washed with DMF). The filtrate was evaporated *in vacuo* and the resulting residue dissolved in DCM (100 mL) and washed with H₂O (20 mL), brine (30 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to give the crude product. Purification by flash chromatography (gradient elution in 1% increments: 100% DCM to 97:3 v/v DCM/MeOH) provided the alkyne **28** as a yellow foam (882 mg, 70% yield).

(iii) *Di-tert-butyl 8,8'-(((5-(1-amino-15-oxo-3,6,9,12-tetraoxa-16-azanonadec-18-yn-19-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate* (**29**)

TBDMSOTf (1.42 mL, 1.64 g, 6.2 mmol) was added to a stirred solution of the tri-Boc protected compound **28** (882 mg, 0.62 mmol) and 2,6-lutidine (0.96 mL, 883 mg, 8.25 mmol) in dry DCM (15 mL) at room temperature. The reaction mixture was allowed to stir under an argon atmosphere for 16 hours during which time analysis by LC/MS revealed formation of the TBS carbamate at retention time 2.09 minutes (ES+) *m/z* 1504 ([M+ Na]⁺, ~100% relative intensity). The reaction mixture was diluted with DCM (60 mL) and washed with saturated NH₄Cl (2 x 20 mL), H₂O (20 mL), brine (30 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to give the crude TBS carbamate. The product was re-dissolved in THF (15 mL) and treated with a solution of TBAF (744 μL of a 1.0M solution in THF, 0.744 mmol) at room temperature. The reaction mixture was allowed to stir for 1 hour at room temperature at which point analysis by LC/MS revealed substantial product formation at retention time 1.45 minutes (ES+) *m/z* 1324 ([M+ H]⁺, ~60% relative intensity) along with product corresponding to 1 N10Boc/1 THP cleaved at retention time 1.29 minutes (ES+) *m/z* 1121 ([M+ H]⁺, ~10% relative intensity), 1138 ([M+ H₂O]⁺, ~20% relative intensity) and product corresponding to 2 N10 Boc/2 THP cleaved at retention time 1.12 minutes (ES+)

m/z 919 ($[M+H]^+$, ~2.5% relative intensity), 937 ($[M+H_2O]^+$, ~3% relative intensity), 955 ($[M+2H_2O]^+$, ~5% relative intensity). The THF was removed by evaporation *in vacuo* and the resulting residue re-dissolved in DCM (60 mL) and washed with saturated NH_4Cl (2 x 20 mL), H_2O (20 mL), brine (30 mL), dried ($MgSO_4$), filtered and evaporated *in vacuo* to give the key amine **29** as a pinkish foam.

(b) (*R*)-2-(pyridin-2-yl)disulfanylpropyl (19-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-15-oxo-3,6,9,12-tetraoxa-16-azanonadec-18-yn-1-yl)carbamate (**33**)

(i) (*R*)-2-(pyridin-2-yl)disulfanylpropyl carbonochloridate (**31**)

Triphosgene (9.36 mg, 31.5 μ mol) was added to a stirred solution of (*R*)-2-(pyridin-2-yl)disulfanylpropan-1-ol (**30**) (18 mg, 0.09 mmol) and pyridine (6.7 μ L, 6.6 mg, 0.08 mmol) in dry DCM (1 mL). The reaction mixture was allowed to stir under an argon atmosphere for 30 minutes after which time the solvent was removed by evaporation *in vacuo* to provide the crude chloroformate **31** as a white foam. Note: The product was carried through to the next step without purification or analysis.

(ii) *Di-tert-butyl 8,8'-(((5-((R)-5,21-dioxo-2-(pyridin-2-yl)disulfanyl)-4,9,12,15,18-pentaoxa-6,22-diazapentacos-24-yn-25-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate) (32)*

A solution of **31** (~23 mg, ~0.09 mmol) in dry DCM (1 mL) was added drop-wise to a stirred solution of amine **29** (~116 mg, ~0.09 mmol) and pyridine (7.8 μ L, 7.7 mg, 0.1 mmol) in dry DCM (1 mL) at room temperature. The reaction mixture was allowed to stir under an argon atmosphere for 3 hours at which point analysis by LC/MS (Kinetex® column) revealed substantial product formation at retention time 2.02 minutes (ES+) *m/z* 1550 ($[M+H]^+$, ~20% relative intensity) along with persistence of unreacted starting material **29** at retention time 1.51 minutes. The solvent was removed by evaporation *in vacuo* to provide the crude carbamate **32** which was carried through to the next step without further purification or analysis.

(iii) *(R)-2-(pyridin-2-yl)disulfanylpropyl (19-(3,5-bis(((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-15-oxo-3,6,9,12-tetraoxa-16-azanonadec-18-yn-1-yl)carbamate (33)*

A solution of 95:5 v/v TFA/H₂O (1 mL) was added to a crude sample of the Boc/THP-protected compound **32** (~136 mg, 88 μ mol) at 0 °C (ice/acetone). After stirring at 0 °C for 1 hour the reaction was deemed complete as judged by LC/MS (Kinetex® column), desired product peak at retention time 1.42 minutes (ES+) *m/z* 1146 ($[M+H]^+$, ~90% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO₃ (50 mL). The mixture was extracted with DCM (3 x 15 mL) and the combined organic layers washed with brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl₃ to 95:5 v/v CHCl₃/MeOH) gave **33** as a film (10 mg, 7% yield): LC/MS (15-minute run), retention time 5.79 minutes (ES+) *m/z* 1146 ($[M+H]^+$, ~8% relative intensity); ¹H NMR (400 MHz, CDCl₃) δ 8.44 (d, 1H, *J* = 4.8 Hz), 7.75–7.58 (m, 2H), 7.66 (d, 2H, *J* = 4.4 Hz), 7.52 (s, 2H), 7.45–7.40 (m, 3H), 7.08–7.05 (m, 1H), 6.95–6.85 (m, 1H), 6.79 (s, 2H), 5.43–5.41 (m, 1H), 5.23–5.09 (m, 8H), 4.30–4.23 (m, 6H), 4.19–4.10 (m, 4H), 3.97–3.94 (m, 2H), 3.96 (s, 6H), 3.91–3.85 (m, 2H), 3.75 (t, 2H, *J* = 5.8 Hz), 3.66–3.58 (m, 8H), 3.52 (t, 2H, *J* = 5.1 Hz), 3.34–3.30 (m, 2H), 3.23–3.08 (m, 3H), 2.96–2.90 (m, 2H), 2.52 (t, 2H, *J* = 5.7 Hz), 1.31 (d, 3H, *J* = 7.0 Hz).

Example 7

(a) (±)-4-(pyridin-2-yl)disulfanyl)pentanoic acid (35)

Aldrithiol™-2 (176 mg, 0.86 mmol) was added to a stirred solution of (±)-4-mercaptopentanoic acid **34** (107 mg, 0.80 mmol, Aurora Fine Chemicals LLC) in EtOH (2 mL) at room temperature. The reaction mixture was allowed to stir for 16 hours under an argon atmosphere at which point analysis by LC/MS revealed substantial product formation at retention time 1.32 minutes (ES+) m/z 244 ($[M+H]^+$, ~95% relative intensity). The solvent was removed by evaporation *in vacuo* and the resulting residue purified by flash chromatography (gradient elution: 90:10 v/v hexane/EtOAc to 80:20 v/v hexane/EtOAc) to give **35** as a white solid (92 mg, 47% yield).

(b) (±)-Di-tert-butyl 8,8'-(((5-(5,21-dioxo-24-(pyridin-2-yl)disulfanyl)-8,11,14,17-tetraoxa-4,20-diazapentacos-1-yn-1-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate) (36)

EDCI (22 mg, 0.12 mmol) was added to a stirred solution of (±)-4-(pyridin-2-yl)disulfanyl)pentanoic acid (**35**) (26 mg, 0.10 mmol) and amine **29** (~139 mg, 0.1 mmol) in

dry DCM (2 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 20 hours at which point analysis by LC/MS showed a substantial amount of desired product (split peak) at retention time 1.88 minutes (ES+) m/z 1548 ($[M+H]^+$, ~40% relative intensity) along with product corresponding to 1 N10Boc/1 THP cleaved at retention time 1.67 minutes (ES+) m/z 1346 ($[M+H]^+$, ~20% relative intensity), 1138 ($[M+H_2O]^+$, ~20% relative intensity) and product corresponding to 2 N10 Boc/2 THP cleaved at retention time 1.43 minutes (ES+ M^+ not observed). The reaction mixture was diluted with DCM (30 mL) and washed with H₂O (15 mL), brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product **36** as a foam.

(c) (±)-N-(3-(3,5-bis((((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)prop-2-yn-1-yl)-1-(4-(pyridin-2-yl)disulfanyl)pentanamido)-3,6,9,12-tetraoxapentadecan-15-amide (**37**)

A solution of 95:5 v/v TFA/H₂O (1 mL) was added to a crude sample of the Boc/THP-protected compound **36** (~163 mg, 0.10 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1 hour the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 1.44 minutes (ES+) m/z 1144 ($[M+H]^+$, ~3% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO₃ (60 mL). The mixture was extracted with DCM (3 x 30 mL) and the combined organic layers washed with brine (30 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl₃ to 96:4 v/v CHCl₃/MeOH) gave **37** as an orange foam (69 mg, 57% yield): LC/MS (15-minute run), retention time 5.72 minutes (ES+) m/z 1144 ($[M+H]^+$, ~3% relative intensity); ¹H NMR (400 MHz, CDCl₃) δ 8.42 (d, 1H, J = 4.3 Hz), 7.72–7.59 (m, 2H), 7.66 (d, 2H, J = 4.3 Hz), 7.52 (s, 2H), 7.45–7.40 (m, 3H), 7.09–7.04 (m, 1H), 6.98–6.94 (m, 1H), 6.80 (s, 2H), 6.40–6.35 (m, 1H), 5.23–5.09 (m, 8H), 4.30–4.23 (m, 6H), 4.19–4.10 (m, 4H), 3.96 (s, 6H), 3.91–3.85 (m, 2H), 3.75 (t, 2H, J = 5.7 Hz), 3.66–3.58 (m, 8H), 3.51 (t, 2H, J = 5.0 Hz), 3.42–3.39 (m, 2H), 3.23–3.08 (m, 2H), 2.96–2.90 (m, 3H), 2.52 (t, 2H, J = 5.6 Hz), 2.34 (t, 2H, J = 7.4 Hz), 1.94 (q, 2H, J = 7.4 Hz), 1.30 (d, 3H, J = 6.7 Hz).

Example 8

(a) 3-(((prop-2-yn-1-yloxy)carbonyl)amino)propanoic acid (39)

A solution of propargyl chloroformate (315 μ L, 383 mg, 3.23 mmol) in toluene (2 mL) was added drop-wise to a stirred mixture of β -alanine (38) (250 mg, 2.81 mmol) and NaHCO_3 (678 mg, 8.1 mmol) in H_2O (7 mL) at room temperature. The reaction mixture was allowed to stir vigorously for 16 hours after which time it was partitioned. The aqueous layer was diluted with H_2O (20 mL), washed with Et_2O (4 x 10 mL), chilled to 0–5 $^\circ\text{C}$ (ice/acetone) and acidified to pH 2 with concentrated HCl. The acidic solution was extracted with EtOAc (3 x 20 mL) and the combined organic layers washed with H_2O (10 mL), brine (20 mL), dried (MgSO_4), filtered and evaporated *in vacuo* to provide the crude product 39 as an oil, which was carried through to the next step without further purification.

(b) Di-tert-butyl 8,8'-(((5-(5,9,25-trioxo-4,13,16,19,22-pentaoxa-6,10,26-triazanonacos-1,28-diyn-29-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate) (40)

EDCI (24 mg, 0.13 mmol) was added to a stirred solution of 3-(((prop-2-yn-1-yloxy)carbonyl)amino)propanoic acid (**39**) (18 mg, 0.10 mmol) and amine **29** (~139 mg, 0.10 mmol) in dry DCM (3 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 1.5 hours at which point analysis by LC/MS showed a substantial amount of desired product at retention time 1.84 minutes (ES+) m/z 1477 ($[M+H]^+$, ~20% relative intensity), 1499 ($[M+Na]^+$, ~22% relative intensity) along with product corresponding to 1 N10Boc/1 THP cleaved at retention time 1.60 minutes (ES+) m/z 1274 ($[M+H]^+$, ~10% relative intensity) and unreacted **5** at retention time 1.47 minutes (ES+) m/z 1324 ($[M+H]^+$, ~5% relative intensity). The reaction mixture was diluted with DCM (20 mL) and washed with H₂O (2 x 10 mL), brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product **40** as a foam.

(c) *Prop-2-yn-1-yl (23-(3,5-bis((((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-3,19-dioxo-7,10,13,16-tetraoxa-4,20-diazatricos-22-yn-1-yl)carbamate (41)*

A solution of 95:5 v/v TFA/H₂O (2 mL) was added to a crude sample of the Boc/THP-protected compound **40** (~155 mg, 0.10 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1.5 hours the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 1.41 minutes (ES+) m/z 1073 ($[M+H]^+$, ~30% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO₃ (60 mL). The mixture was extracted with DCM (3 x 20 mL) and the combined organic layers washed with brine (25 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl₃ to 95:5 v/v CHCl₃/MeOH) gave **41** as a yellow foam (51 mg, 45% yield): LC/MS (15-minute run), retention time 5.71 minutes (ES+) m/z 1073 ($[M+H]^+$, ~30% relative intensity); ¹H NMR (400 MHz, CDCl₃) δ 7.67 (d, 2H, J = 4.5 Hz), 7.52 (s, 2H), 7.46–7.43 (m, 3H), 7.07–7.02 (m, 1H), 6.80 (s, 2H), 6.64–6.57 (m, 1H), 5.78–5.72 (m, 1H), 5.21–5.09 (m, 8H), 4.64 (d, 2H, J = 2.2 Hz), 4.29–4.25 (m, 6H), 3.96 (s, 6H), 3.90–3.85 (m, 2H), 3.76 (t, 2H, J = 5.9 Hz), 3.65–3.35 (m, 18H), 3.16–3.07 (m, 2H), 2.93 (d, 2H, J = 16 Hz), 2.52 (t, 2H, J = 5.9 Hz), 2.48–2.45 (m, 1H), 2.40 (t, 2H, J = 5.9 Hz).

Example 9

(a) Di-tert-butyl 8,8'-(((5-(1-(4-((S)-2-((S)-2-(6-(2,5-dioxo-2,5-dihydro-1H-pyrrol-1-yl)hexanamido)-3-methylbutanamido)-5-ureidopentanamido)phenyl)-3,19-dioxo-2,7,10,13,16-pentaoxa-4,20-diazatricos-22-yn-23-yl)-1,3-phenylene)bis(methylene))bis(oxy)))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate) (**43**)

DIPEA (44 μ L, 32 mg, 0.25 mmol) was added to a stirred solution of key amine **29** (~155 mg, 0.11 mmol) and the nitrophenyl carbonate **42** (84 mg, 0.11 mmol) in dry DMF (3 mL) at room temperature. The reaction mixture was allowed to stir under an argon atmosphere for 3 days after which time analysis by LC/MS revealed desired product observed at retention time 1.80 minutes (ES+) m/z 1922 ($[M+H]^+$, ~40% relative intensity), 1944 ($[M+Na]^+$, ~20% relative intensity) along with product corresponding to 1 N10Boc/1 THP cleaved at retention time 1.61 minutes (ES+) m/z 1720 ($[M+H]^+$, ~20% relative intensity). The DMF was removed by

evaporation *in vacuo* and the resulting product **43** carried through to the next step without further purification or analysis.

(b) 4-((S)-2-((S)-2-(6-(2,5-dioxo-2,5-dihydro-1H-pyrrol-1-yl)hexanamido)-3-methylbutanamido)-5-ureidopentanamido)benzyl (19-(3,5-bis(((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-15-oxo-3,6,9,12-tetraoxa-16-azanonadec-18-yn-1-yl)carbamate (**44**)

A solution of 95:5 v/v TFA/H₂O (3 mL) was added to a crude sample of the Boc/THP-protected compound **43** (~173 mg, 0.11 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1.5 hours the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 1.42 minutes (ES+) *m/z* 1518 ([*M*+ H]⁺, ~40% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO₃ (100 mL). The mixture was extracted with DCM (3 x 30 mL) and the combined organic layers washed with brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl₃ to 80:20 v/v CHCl₃/MeOH) gave crude product as a yellow foam (72 mg, 42% crude yield). The material was further purified by preparative HPLC to provide pure **44** as a thin film (4.5 mg, 3% yield): LC/MS (15-minute run), retention time 5.44 minutes (ES+) *m/z* 1518 ([*M*+ H]⁺, ~30% relative intensity).

Example 10

(a) 1-(3-aminopropanamido)-N-(3-(3,5-bis(((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)prop-2-yn-1-yl)-3,6,9,12-tetraoxapentadecan-15-amide (**47**)

(i) Di-tert-butyl 8,8'-(((5-(1-(9H-fluoren-9-yl)-3,7,23-trioxo-2,11,14,17,20-pentaoxa-4,8,24-triazaheptacos-26-yn-27-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate) (**45**)

EDCI (49 mg, 0.25 mmol) was added to a stirred solution of Fmoc- β -alanine (66 mg, 0.21 mmol) and amine **29** (~279 mg, 0.21 mmol) in dry DCM (5 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 3 hours at which point analysis by LC/MS showed a substantial amount of desired product at retention time 1.76 minutes (ES+) m/z 1617 ($[M+H]^+$, ~10% relative intensity), 1639 ($[M+Na]^+$, ~80% relative intensity) along with product corresponding to 1 N10Boc/1 THP cleaved at retention time 1.56 minutes (ES+) m/z 1415 ($[M+H]^+$, ~10% relative intensity). The reaction mixture was diluted with DCM (30 mL) and washed with H₂O (20 mL), brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product **45** as a foam.

(ii) (9H-fluoren-9-yl)methyl (23-(3,5-bis(((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)-3,19-dioxo-7,10,13,16-tetraoxa-4,20-diazatricos-22-yn-1-yl)carbamate (**46**)

A solution of 95:5 v/v TFA/H₂O (4 mL) was added to a crude sample of the Boc/THP-protected compound **45** (~341 mg, 0.21 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1 hour the reaction was deemed complete as judged by LC/MS, desired product peak at

retention time 1.44 minutes (ES+) m/z 1212 ($[M+H]^+$, ~30% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO_3 (80 mL). The mixture was extracted with DCM (3 x 20 mL) and the combined organic layers washed with NaHCO_3 (2 x 20 mL), brine (20 mL), dried (MgSO_4), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl_3 to 95:5 v/v $\text{CHCl}_3/\text{MeOH}$) gave pure product **46** as a yellow foam (179 mg, 70% yield).

(iii) 1-(3-aminopropanamido)-N-(3-(3,5-bis((((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)prop-2-yn-1-yl)-3,6,9,12-tetraoxapentadecan-15-amide (**47**)

Dimethylamine (735 μL of a 2.0M solution in THF, 1.47 mmol) was added to a stirred solution of the Fmoc protected compound **46** (89 mg, 73.5 μmol) in THF (3 mL) at room temperature. After stirring for 3 hours at room temperature, analysis by LC/MS revealed reaction completion with desired product at retention time 1.14 minutes (ES+) m/z 990 ($[M+H]^+$, ~8% relative intensity), 1008 ($[M+H_2O]^+$, ~10% relative intensity), 1026 ($[M+2H_2O]^+$, ~15% relative intensity) along with Fmoc cleavage by-product at retention time 1.88 minutes. The mixture was evaporated *in vacuo* and crude **47** was carried through to next step without further purification or analysis.

(b) *N*-(3-(3,5-bis(((*S*)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1*H*-pyrrolo[2,1-*c*][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)prop-2-yn-1-yl)-1-(3-(2-bromoacetamido)propanamido)-3,6,9,12-tetraoxapentadecan-15-amide

(48)

Bromoacetic anhydride (23 mg, 88.2 μmol) was added to a stirred solution of the crude amine **47** (~73 mg, 73.5 μmol) in DCM (3 mL). The reaction mixture was allowed to stir under an argon atmosphere at room temperature for 3 hours at which point analysis by LC/MS revealed completion of reaction with desired product observed at retention time 1.34 minutes (ES+) m/z 1112 ($[M+H]^+$, ~30% relative intensity). The solvent was removed by evaporation *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl_3 to 93:7 v/v $\text{CHCl}_3/\text{MeOH}$) gave the product as a yellow foam (38 mg, 46% crude yield). The material was further purified by preparative HPLC to provide pure **48** as a thin film (5 mg, 6% yield): LC/MS (15-minute run), retention time 4.96 minutes (ES+) m/z 1112 ($[M+H]^+$, ~10% relative intensity); ^1H NMR (400 MHz, CDCl_3) δ 7.67 (d, 2H, $J = 4.4$ Hz), 7.52 (s, 2H), 7.46–7.43 (m, 4H), 7.10–7.07 (m, 1H), 6.80 (s, 2H), 5.21–5.09 (m, 8H), 4.29–4.25 (m, 6H), 3.96 (s, 6H), 3.90–3.85 (m, 2H), 3.82 (s, 2H), 3.77 (t, 2H, $J = 5.9$ Hz), 3.65–3.40 (m, 18H), 3.16–3.07 (m, 2H), 2.94 (d, 2H, $J = 16$ Hz), 2.53 (t, 2H, $J = 5.9$ Hz), 2.43 (t, 2H, $J = 5.9$ Hz).

Example 11 – Alternate synthesis of 10

(a) *di-tert-Butyl 8,8'-(((5-(1-(2,5-dioxo-2,5-dihydro-1H-pyrrol-1-yl)-3,19-dioxo-7,10,13,16-tetraoxa-4,20-diazatricos-22-yn-23-yl)-1,3-phenylene)bis(methylene))bis(oxy))(11S,11aS,11'S,11a'S)-bis(7-methoxy-2-methylene-5-oxo-11-((tetrahydro-2H-pyran-2-yl)oxy)-2,3,11,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepine-10(5H)-carboxylate (9)*

EDCI (61 mg, 0.32 mmol) was added to a stirred solution of *N*-maleoyl- β -alanine (53 mg, 0.32 mmol) and amine **29** (~418 mg, 0.32 mmol) in dry DCM (6 mL) at room temperature. The reaction mixture was stirred under an argon atmosphere for 3 hours at which point analysis by LC/MS showed a substantial amount of desired product at retention time 1.80 minutes (ES+) *m/z* 1474 ($[M+H]^+$, ~15% relative intensity), 1497 ($[M+Na]^+$, ~100% relative intensity), along with product corresponding to 1 N10Boc/1 THP cleaved at retention time 1.56 minutes 1272 ($[M+H]^+$, ~80% relative intensity), 1295 ($[M+Na]^+$, ~45% relative intensity) and product corresponding to 2 N10 Boc/2 THP cleaved at retention time 1.31 minutes (ES+ *M+* not observed). The reaction mixture was diluted with DCM (30 mL) and washed with H₂O (15 mL), brine (20 mL), dried (MgSO₄), filtered and evaporated *in vacuo* to provide the crude product **9** as a foam.

(b) *N-(3-(3,5-bis((((S)-7-methoxy-2-methylene-5-oxo-2,3,5,11a-tetrahydro-1H-pyrrolo[2,1-c][1,4]benzodiazepin-8-yl)oxy)methyl)phenyl)prop-2-yn-1-yl)-1-(3-(2,5-dioxo-2,5-dihydro-1H-pyrrol-1-yl)propanamido)-3,6,9,12-tetraoxapentadecan-15-amide (10)*

A solution of 95:5 v/v TFA/H₂O (5 mL) was added to a crude sample of the Boc/THP-protected compound **9** (~466 mg, 0.32 mmol) at 0 °C (ice/acetone). After stirring at 0 °C for 1

hour the reaction was deemed complete as judged by LC/MS, desired product peak at retention time 1.32 minutes (ES+) m/z 1070 ($[M+H]^+$, ~100% relative intensity). The reaction mixture was kept cold and added drop-wise to a chilled saturated aqueous solution of NaHCO_3 (120 mL). The mixture was extracted with DCM (3 x 40 mL) and the combined organic layers washed with brine (50 mL), dried (MgSO_4), filtered and evaporated *in vacuo* to provide the crude product. Purification by flash chromatography (gradient elution: 100% CHCl_3 to 96:4 v/v $\text{CHCl}_3/\text{MeOH}$) gave **10** as an orange foam (202 mg, 60% yield): $[\alpha]_D^{21} = +351^\circ$ ($c = 0.47$, CHCl_3); LC/MS (15-minute run), retention time 4.88 minutes (ES+) m/z 1070 ($[M+H]^+$, ~100% relative intensity); ^1H NMR (400 MHz, CDCl_3) δ 7.66 (d, 2H, $J = 4.4$ Hz), 7.52 (s, 2H), 7.45–7.40 (m, 3H), 6.98–6.94 (m, 1H), 6.80 (s, 2H), 6.66 (s, 2H), 6.55–6.50 (m, 1H), 5.22–5.07 (m, 8H), 4.30–4.22 (m, 6H), 3.96 (s, 6H), 3.91–3.85 (m, 2H), 3.82 (t, 2H, $J = 7.2$ Hz), 3.76 (t, 2H, $J = 5.8$ Hz), 3.65–3.43 (m, 16H), 3.16–3.08 (m, 2H), 2.94 (d, 2H, $J = 15.7$ Hz), 2.54–2.44 (m, 4H).

Reduction/Oxidation of ThioMabs for Conjugation

Full length, cysteine engineered monoclonal antibodies (ThioMabs - Junutula, et al., 2008b Nature Biotech., 26(8):925-932; Dorman et al (2009) Blood 114(13):2721-2729; US 7521541; US 7723485; WO2009/052249, Shen et al (2012) Nature Biotech., 30(2):184-191; Junutula et al (2008) Jour of Immun. Methods 332:41-52) expressed in CHO cells were reduced with about a 20-40 fold excess of TCEP (tris(2-carboxyethyl)phosphine hydrochloride or DTT (dithiothreitol) in 50 mM Tris pH 7.5 with 2 mM EDTA for 3 hrs at 37°C or overnight at room temperature. (Getz et al (1999) Anal. Biochem. Vol 273:73-80; Soltec Ventures, Beverly, MA). The reduced ThioMab was diluted and loaded onto a HiTrap S column in 10 mM sodium acetate, pH 5, and eluted with PBS containing 0.3M sodium chloride. Alternatively, the antibody was acidified by addition of 1/20th volume of 10% acetic acid, diluted with 10 mM succinate pH 5, loaded onto the column and then washed with 10 column volumes of succinate buffer. The column was eluted with 50 mM Tris pH7.5, 2 mM EDTA.

The eluted reduced ThioMab was treated with 15 fold molar excess of DHAA (dehydroascorbic acid) or 200 nM aqueous copper sulfate (CuSO_4). Oxidation of the interchain disulfide bonds was complete in about three hours or more. Ambient air oxidation was also effective. The re-oxidized antibody was dialyzed into 20 mM sodium succinate pH 5, 150 mM NaCl, 2 mM EDTA and stored frozen at -20°C.

Conjugation of Thio-Mabs with Compounds to prepare antibody-drug conjugates

The deblocked, reoxidized, thio-antibodies (ThioMab) were reacted with 6-8 fold molar excess of compounds 7, 10, 13, 17, 24, 25, 33, 37, 44, 48 (from a DMSO stock at a concentration of 20 mM) in 50 mM Tris, pH 8, until the reaction was complete (16-24 hours) as determined by LC-MS analysis of the reaction mixture.

The crude antibody-drug conjugates (ADC) were then applied to a cation exchange column after dilution with 20 mM sodium succinate, pH 5. The column was washed with at least 10 column volumes of 20 mM sodium succinate, pH 5, and the antibody was eluted with PBS. The antibody drug conjugates were formulated into 20 mM His/acetate, pH 5, with 240 mM sucrose using gel filtration columns. The antibody-drug conjugates were characterized by UV spectroscopy to determine protein concentration, analytical SEC (size-exclusion chromatography) for aggregation analysis and LC-MS before and after treatment with Lysine C endopeptidase.

Size exclusion chromatography was performed using a Shodex KW802.5 column in 0.2M potassium phosphate pH 6.2 with 0.25 mM potassium chloride and 15% IPA at a flow rate of 0.75 ml/min. Aggregation state of the conjugate was determined by integration of eluted peak area absorbance at 280 nm.

LC-MS analysis was performed using an Agilent QTOF 6520 ESI instrument. As an example, an antibody-drug conjugate generated using this chemistry was treated with 1:500 w/w Endoproteinase Lys C (Promega) in Tris, pH 7.5, for 30 min at 37°C. The resulting cleavage fragments were loaded onto a 1000A, 8 um PLRP-S column heated to 80°C and eluted with a gradient of 30% B to 40% B in 5 minutes. Mobile phase A was H₂O with 0.05% TFA and mobile phase B was acetonitrile with 0.04% TFA. The flow rate was 0.5ml/min. Protein elution was monitored by UV absorbance detection at 280 nm prior to electrospray ionization and MS analysis. Chromatographic resolution of the unconjugated Fc fragment, residual unconjugated Fab and drugged Fab was usually achieved. The obtained m/z spectra were deconvoluted using Mass Hunter™ software (Agilent Technologies) to calculate the mass of the antibody fragments.

The following in vitro and in vivo assays are also described in Phillips et al (2008) Cancer Res. 68(22):9280-9290.

In vitro cell proliferation assay

Efficacy of ADC were measured by a cell proliferation assay employing the following protocol (CellTiter Glo Luminescent Cell Viability Assay, Promega Corp. Technical Bulletin TB288; Mendoza et al (2002) Cancer Res. 62:5485-5488). All cell lines were obtained from American Type Culture Collection:

1. An aliquot of 100 μ l of cell culture containing about 10^4 cells (for example, KPL-4, a human breast cancer cell line, Kurebayashi et al (1999) Brit. Jour. Cancer 79(5-6):707-717), or SKBR-3) in medium was deposited in each well of a 96-well, opaque-walled plate.
2. Control wells were prepared containing medium and without cells.
3. ADC was added to the experimental wells and incubated for 3-5 days.
4. The plates were equilibrated to room temperature for approximately 30 minutes.
5. A volume of CellTiter-Glo Reagent equal to the volume of cell culture medium present in each well was added.
6. The contents were mixed for 2 minutes on an orbital shaker to induce cell lysis.
7. The plate was incubated at room temperature for 10 minutes to stabilize the luminescence signal.
8. Luminescence was recorded and reported in graphs as RLU = relative luminescence units.

Certain cells are seeded at 1000-2000/well or 2000-3000/well in a 96-well plate, 50 μ L/well. After one or two days, ADC are added in 50 μ L volumes to final concentration of 9000, 3000, 1000, 333, 111, 37, 12.4, 4.1, or 1.4 ng/mL, with "no ADC" control wells receiving medium alone. Conditions are in duplicate or triplicate After 3-5 days, 100 μ L/well Cell TiterGlo II is added (luciferase-based assay; proliferation measured by ATP levels) and cell counts are determined using a luminometer. Data are plotted as the mean of luminescence for each set of replicates, with standard deviation error bars. The protocol is a modification of the CellTiter Glo Luminescent Cell Viability Assay (Promega):

1. Plate 1000 cells/ well in 50 μ L/well of FBS/glutamine media. Allow cells to attach overnight.
2. ADC is serially diluted 1:3 in media beginning at at working concentration 18 μ g/ml (this results in a final concentration of 9 μ g/ml). 50 μ L of diluted ADC is added to the 50 μ L of cells and media already in the well.
3. Incubate 72-96 hrs (the standard is 72 hours, but watch the 0 ug/mL concentration to stop assay when the cells are 85-95% confluent).
4. Add 100 μ L/well of Promega Cell Titer Glo reagent, shake 3 min. and read on luminometer

Results

Antibody-drug conjugates, trastuzumab-7 (**110**) trastuzumab-10 (**120**) and trastuzumab-17 (**130**) were tested against SK-BR-3, KPL-4, and MCF-7 (Levenson et al (1997) *Cancer Res.* 57(15):3071-3078) cells to measure *in vitro* cell viability in five day studies. The IC₅₀ value (ng/mL) for **110** against SK-BR-3 was 22.90. The IC₅₀ value for **120** against SK-BR-3 was 11.14. The IC₅₀ value for **130** against SK-BR-3 was 16.8. SK-BR-3 cells are HER2+ expressing, trastuzumab sensitive. **110**, **120** and **130** were effectively inactive against MCF-7, which is a HER2 non-expressing human breast adenocarcinoma cell line. Thus, conjugates **110**, **120** and **130** demonstrate targetted cell killing potency.

Tumor growth inhibition, in vivo efficacy in high expressing HER2 transgenic explant mice

Animals suitable for transgenic experiments can be obtained from standard commercial sources such as Taconic (Germantown, N.Y.). Many strains are suitable, but FVB female mice are preferred because of their higher susceptibility to tumor formation. FVB males were used for mating and vasectomized CD.1 studs were used to stimulate pseudopregnancy. Vasectomized mice can be obtained from any commercial supplier. Founders were bred with either FVB mice or with 129/BL6 x FVB p53 heterozygous mice. The mice with heterozygosity at p53 allele were used to potentially increase tumor formation. However, this has proven unnecessary. Therefore, some F1 tumors are of mixed strain. Founder tumors are FVB only. Six founders were obtained with some developing tumors without having litters.

Animals having tumors (allograft propagated from Fo5 mmtv transgenic mice) were treated with a single or multiple dose by IV injection of ADC. Tumor volume was assessed at various time points after injection.

Tumors arise readily in transgenic mice that express a mutationally activated form of neu, the rat homolog of HER2, but the HER2 that is overexpressed in human breast cancers is not mutated and tumor formation is much less robust in transgenic mice that overexpress nonmutated HER2 (Webster *et al* (1994) *Semin. Cancer Biol.* 5:69-76).

To improve tumor formation with nonmutated HER2, transgenic mice were produced using a HER2 cDNA plasmid in which an upstream ATG was deleted in order to prevent initiation of translation at such upstream ATG codons, which would otherwise reduce the frequency of translation initiation from the downstream authentic initiation codon of HER2 (for example, see Child *et al* (1999) *J. Biol. Chem.* 274: 24335-24341). Additionally, a chimeric intron was added to the 5' end, which should also enhance the level of expression as reported earlier (Neuberger and Williams (1988) *Nucleic Acids Res.* 16:6713; Buchman and Berg (1988) *Mol. Cell. Biol.* 8:4395; Brinster *et al* (1988) *Proc. Natl. Acad. Sci. USA* 85:836). The chimeric intron was derived from a Promega vector, Pci-neo mammalian expression vector (bp 890-1022). The cDNA 3'-end is flanked by human growth hormone exons 4 and 5, and polyadenylation sequences. Moreover, FVB mice were used because this strain is more susceptible to tumor development. The promoter from MMTV-LTR was used to ensure tissue-specific HER2 expression in the mammary gland. Animals were fed the AIN 76A diet in order to increase susceptibility to tumor formation (Rao *et al* (1997) *Breast Cancer Res. and Treatment* 45:149-158).

Fo5 murine mammary tumor model

The Fo5 model is a transgenic mouse model in which the human HER2 gene, under transcriptional regulation of the murine mammary tumor virus promoter (MMTV-HER2), is overexpressed in mammary epithelium. The overexpression causes spontaneous development of mammary tumors that overexpress the human HER2 receptor. The mammary tumor of one of the founder animals (founder #5 [Fo5]) has been propagated in subsequent generations of FVB mice by serial transplantation of tumor fragments. Before being used for an in vivo efficacy study, the MMTV-HER2 Fo5 transgenic mammary tumor was surgically transplanted into the No. 2/3 mammary fat pad of nu/nu mice (from Charles River Laboratories) in fragments that measured approximately 2x2 mm. When tumors reached desired volumes, the tumor-bearing mice were randomized and given a single dose by IV injection of the ADC.

Results

Figure 1 shows a plot of the in vivo mean tumor volume change over time in breast cancer-model MMTV-HER2 Fo5 mammary allograft tumors inoculated into CRL nu/nu mice after single iv dosing on day 0 with: (1) Vehicle 20mM Histidine acetate, pH 5.5, 240mM sucrose, (2) xCD22-7 (115) at 6 mg/kg, (3) trastuzumab-7 (110) at 1 mg/kg, (4) trastuzumab-7 (110) at 3 mg/kg, and (5) trastuzumab-7 (110) at 6 mg/kg. The lines in the figure are indicated with the following symbols:

- X— Vehicle
- ADC110 Tmab-7 HC A118C, 1 mg/kg
- ▲— ADC110 Tmab-7 HC A118C, 3 mg/kg
- ADC110 Tmab-7 HC A118C, 6 mg/kg
- ▼--- ADC115 CD22-7 HC A118C, 6 mg/kg

Figure 2 shows a plot of the in vivo mean tumor volume change over time in breast cancer-model MMTV-HER2 Fo5 mammary allograft tumors inoculated into CRL nu/nu mice after single IV dosing on day 0 with: (1) Vehicle 20 mM Histidine acetate, pH 5.5, 240 mM sucrose, (2) xCD22-10 (125) at 3 mg/kg, (3) trastuzumab-10 (120) at 0.3 mg/kg, (4) trastuzumab-10 (120) at 1 mg/kg, and (5) trastuzumab-10 (120) at 3 mg/kg. The lines in the figure are indicated with the following symbols:

- X— Vehicle
- ADC120 Tmab-10 HC A118C, 0.3 mg/kg
- ◆— ADC120 Tmab-10 HC A118C, 1 mg/kg
- ADC120 Tmab-10 HC A118C, 3 mg/kg
- ▼--- ADC125 CD22 HC A118C, 3 mg/kg

Figure 3 shows a plot of the in vivo mean tumor volume change over time in breast cancer-model MMTV-HER2 Fo5 mammary allograft tumors inoculated into CRL nu/nu mice after single iv dosing on day 0 with: (1) Vehicle 20 mM Histidine acetate, pH 5.5, 240 mM sucrose, (2) xCD22-17 (135) at 3 mg/kg, (3) trastuzumab-17 (130) at 0.3 mg/kg, (4) trastuzumab-17 (130) at 1 mg/kg, and (5) trastuzumab-17 (130) at 3 mg/kg. The lines in the figure are indicated with the following symbols:

- ~~X~~— Vehicle
- ▲— ADC130 Tmab-17 HC A118C, 0.3 mg/kg
- ADC130 Tmab-17 HC A118C, 1 mg/kg
- ADC130 Tmab-17 HC A118C, 3 mg/kg
- +— ADC135 CD22 HC A118C, 3 mg/kg

Abbreviations

Ac	acetyl
Acm	acetamidomethyl
Alloc	allyloxycarbonyl
Boc	di- <i>tert</i> -butyl dicarbonate
t-Bu	<i>tert</i> -butyl
Bzl	benzyl, where Bzl-OMe is methoxybenzyl and Bzl-Me is methylbenzene
Cbz or Z	benzyloxy-carbonyl, where Z-Cl and Z-Br are chloro- and bromobenzyloxy carbonyl respectively
DMF	<i>N,N</i> -dimethylformamide
Dnp	dinitrophenyl
DTT	dithiothreitol
Fmoc	9 <i>H</i> -fluoren-9-ylmethoxycarbonyl
imp	<i>N</i> -10 imine protecting group: 3-(2-methoxyethoxy)propanoate-Val-Ala-PAB
MC-OSu	maleimidocaproyl- <i>O-N</i> -succinimide
Moc	methoxycarbonyl
MP	maleimidopropanamide
Mtr	4-methoxy-2,3,6-trimethylbenzenesulfonyl
PAB	para-aminobenzyloxycarbonyl
PEG	ethyleneoxy
PNZ	<i>p</i> -nitrobenzyl carbamate
Psec	2-(phenylsulfonyl)ethoxycarbonyl
TBDMS	<i>tert</i> -butyldimethylsilyl
TBDPS	<i>tert</i> -butyldiphenylsilyl
Teoc	2-(trimethylsilyl)ethoxycarbonyl
Tos	tosyl
Troc	2,2,2-trichloroethoxycarbonyl chloride
Trt	trityl
Xan	xanthyl

Claims

1. A conjugate of formula (A):

wherein:

R^2 is $\text{C}(\text{R}^{36a})=\text{C}(\text{R}^{36b})\text{H}$, where R^{36a} and R^{36b} are independently selected from H, F, C_{1-4} saturated alkyl, C_{2-3} alkenyl, which alkyl and alkenyl groups are optionally substituted by a group selected from C_{1-4} alkyl amido and C_{1-4} alkyl ester; or, when one of R^{36a} and R^{36b} is H, the other is selected from nitrile and a C_{1-4} alkyl ester;

R^6 and R^9 are independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR' , NO_2 , Me_3Sn and halo;

R^7 is independently selected from H, R, OH, OR, SH, SR, NH_2 , NHR, NRR' , NO_2 , Me_3Sn and halo;

Y is selected from formulae A1, A2, A3, A4, A5 and A6:

L is a linker connected to a cell binding agent;

CBA is the cell binding agent;

n is an integer selected in the range of 0 to 48;

R^{A4} is a C_{1-6} alkylene group;

either

(a) R^{10} is H, and R^{11} is OH, OR^A , where R^A is C_{1-4} alkyl; or

(b) R^{10} and R^{11} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound; or

(c) R^{10} is H and R^{11} is OSO_zM , where z is 2 or 3 and M is a monovalent pharmaceutically acceptable cation;

R and R' are each independently selected from optionally substituted C_{1-12} alkyl, C_{3-20} heterocyclyl and C_{5-20} aryl groups, and optionally in relation to the group NRR' , R and R' together with the nitrogen atom to which they are attached form an optionally substituted 4-, 5-, 6- or 7-membered heterocyclic ring;

wherein R^{16} , R^{17} , R^{19} , R^{20} , R^{21} and R^{22} are as defined for R^6 , R^7 , R^9 , R^{10} , R^{11} and R^2 respectively;

wherein Z is CH or N;

wherein T and T' are independently selected from a single bond or a C_{1-9} alkylene, which chain may be interrupted by one or more heteroatoms e.g. O, S, N(H), NMe, provided

that the number of atoms in the shortest chain of atoms between X and X' is 3 to 12 atoms;
and

X and X' are independently selected from O, S and N(H).

2. The conjugate according to claim 1, wherein R⁹ is H.
3. The conjugate according to either claim 1 or claim 2, wherein R⁶ is H.
4. The conjugate according to any one of claims 1 to 3, wherein R⁷ is OR^{7A}, where R^{7A} is optionally substituted C₁₋₄ alkyl.
5. The conjugate of claim 4, wherein R^{7A} is Me.
6. The conjugate according to any one of claims 1 to 5, wherein X is O.
7. The conjugate according to any one of claims 1 to 6, wherein T is selected from a single bond, C₁, and a C₂ alkylene group.
8. The conjugate according to claim 7, wherein T is a C₁ alkylene group.
9. The conjugate according to any one of claims 1 to 8, wherein R^{36a} and R^{36b} are both H.
10. The conjugate according to any one of claims 1 to 8, wherein R^{36a} and R^{36b} are both methyl.
11. The conjugate according to any one of claims 1 to 8, wherein one of R^{36a} and R^{36b} is H, and the other is selected from C₁₋₄ saturated alkyl, C₂₋₃ alkenyl, which alkyl and alkenyl groups are optionally substituted.
12. The conjugate according to claim 11, wherein the group of R^{36a} and R^{36b} which is not H is selected from methyl and ethyl.
13. The conjugate according to any one of claims 1 to 12, wherein R¹⁰ is H, and R¹¹ is OH.

14. The conjugate according to any one of claims 1 to 12, wherein R¹⁰ and R¹¹ form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound.

15. The conjugate according to any one of claims 1 to 14, wherein R¹⁶, R¹⁷, R¹⁹, R²⁰, R²¹, R²², X' and T' are the same as R⁶, R⁷, R⁹, R¹⁰, R¹¹, R², X and T respectively

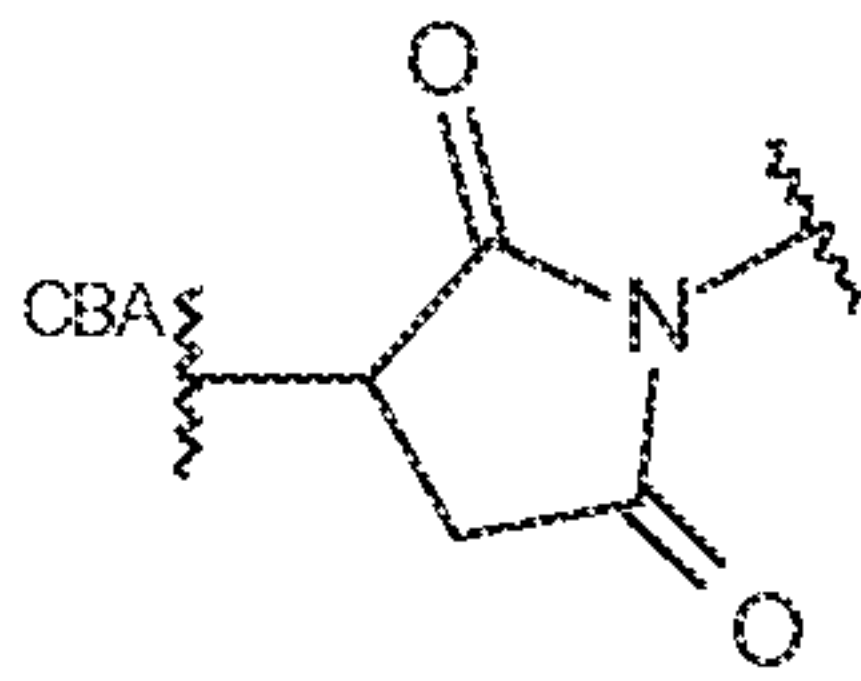

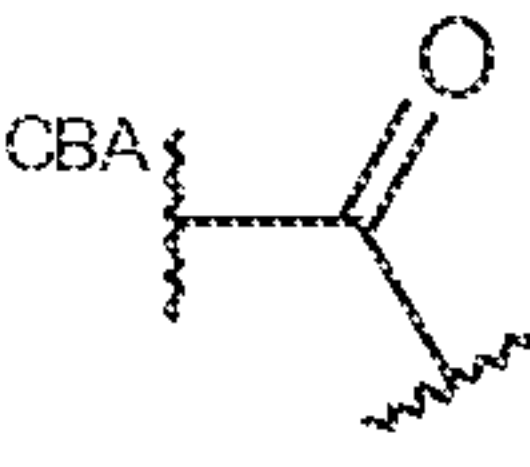

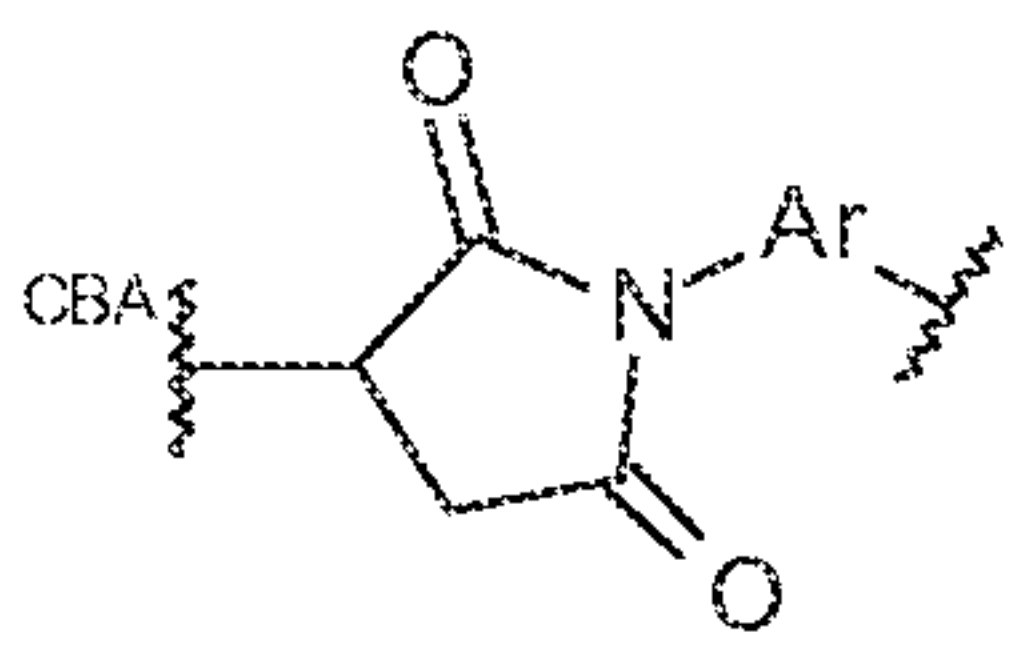

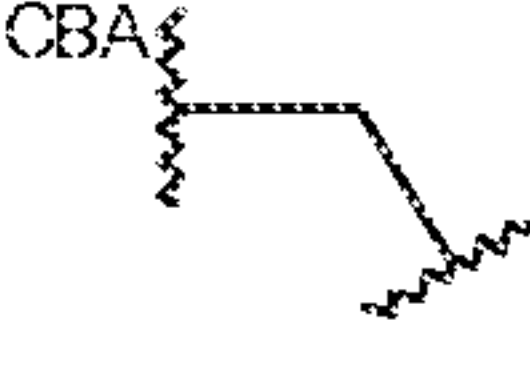

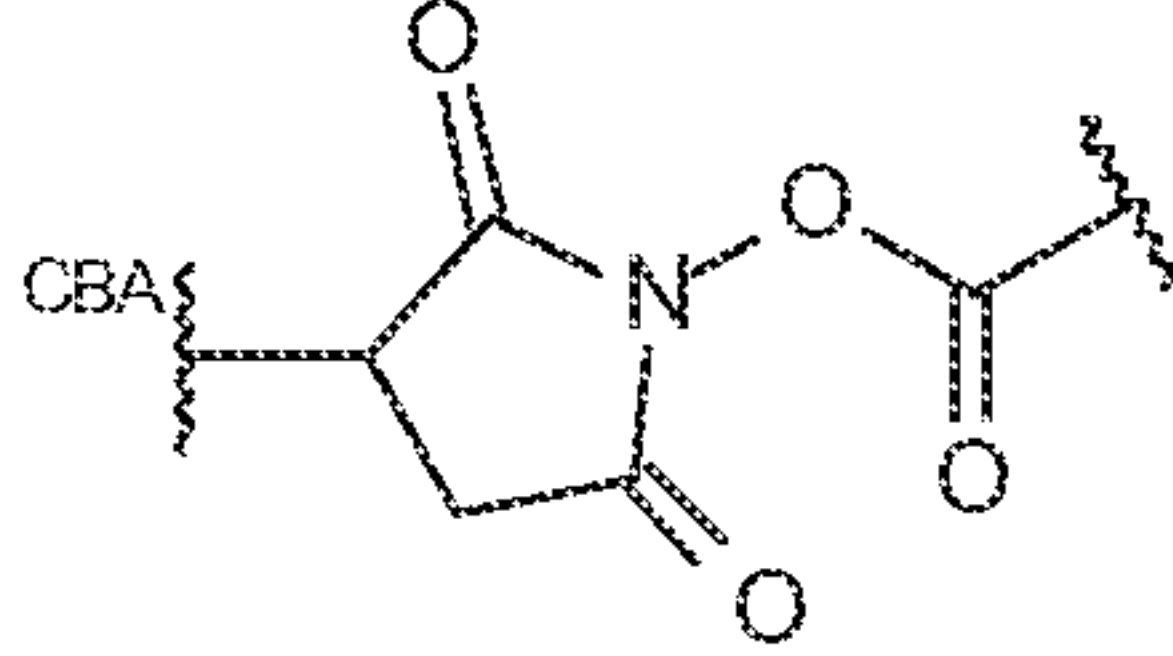

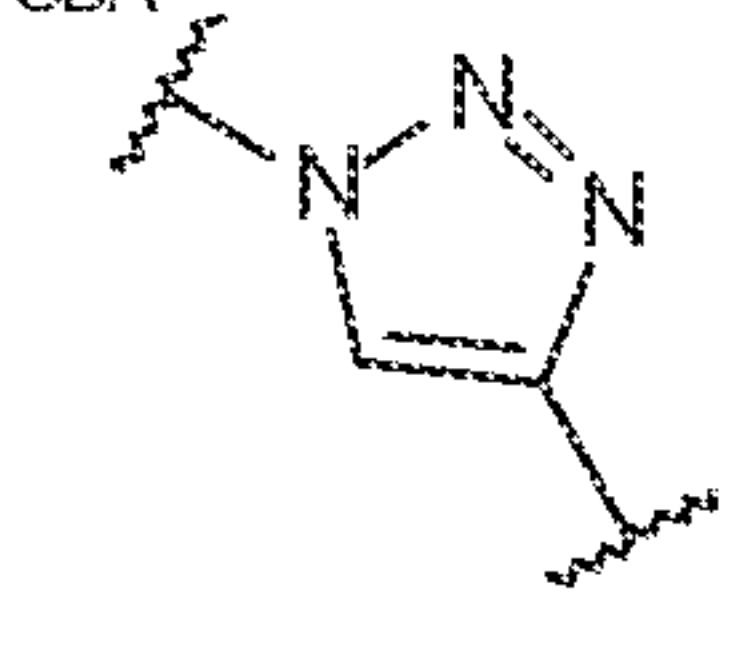

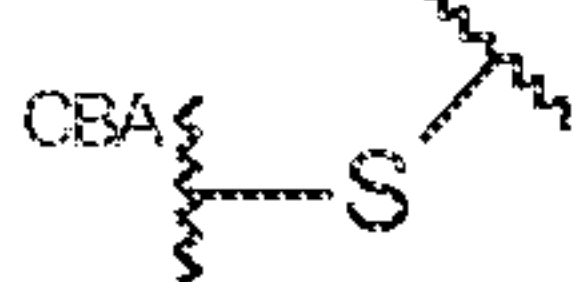

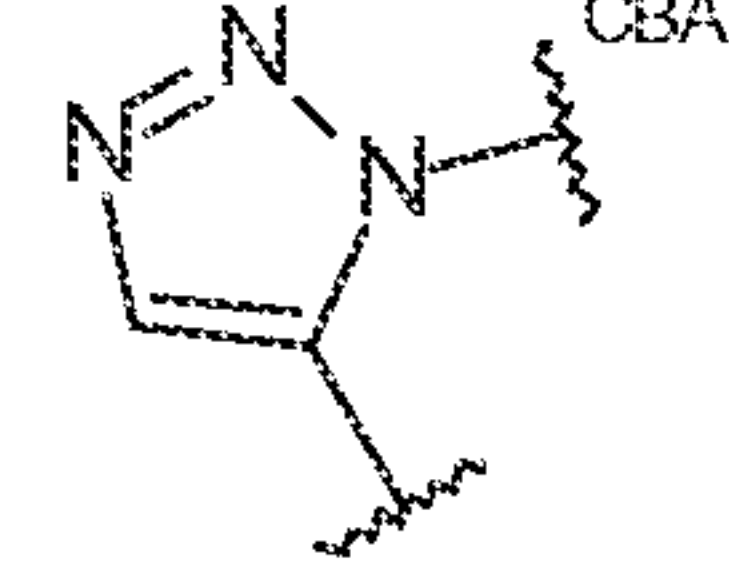

16. The conjugate according to any one of claims 1 to 15, wherein the group L contains a moiety derived from an electrophilic functional group selected from (i) maleimide groups (ii) activated disulfides, (iii) active esters such as NHS (N-hydroxysuccinimide) esters, HOBt (N-hydroxybenzotriazole) esters, haloformates, and acid halides; (iv) alkyl and benzyl halides such as haloacetamides; and (v) aldehydes, ketones, carboxyl.

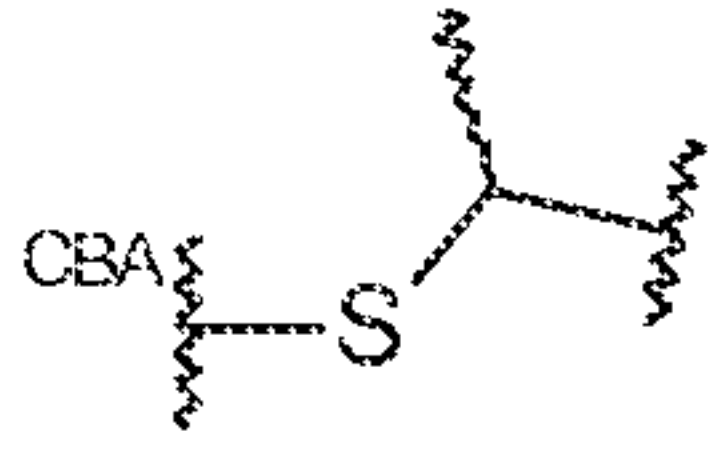

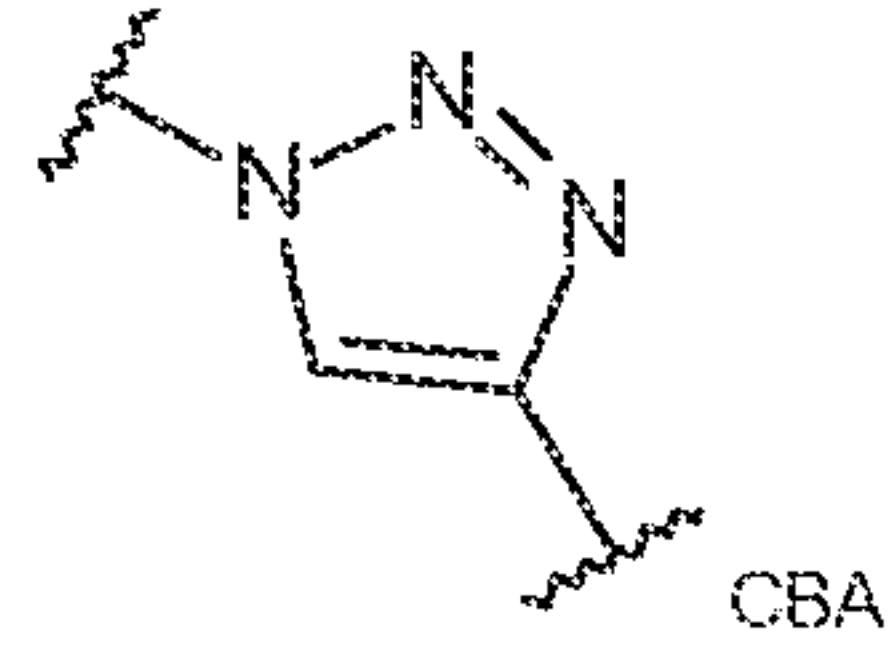

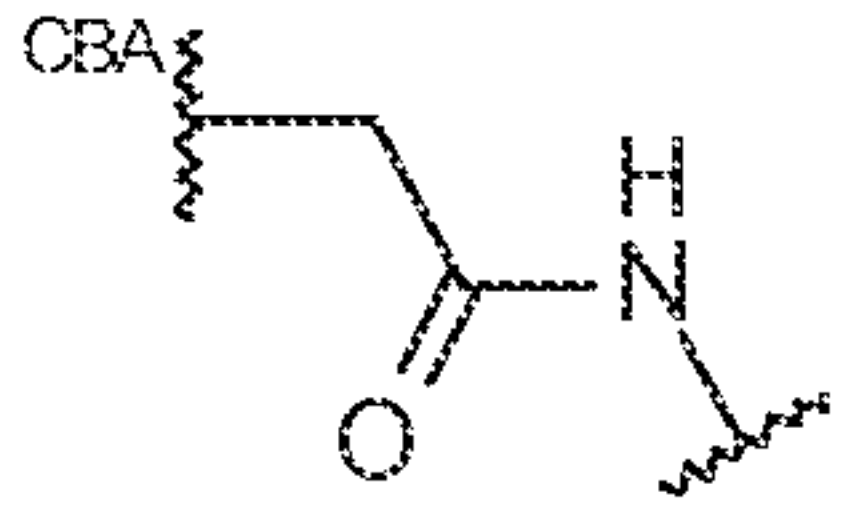

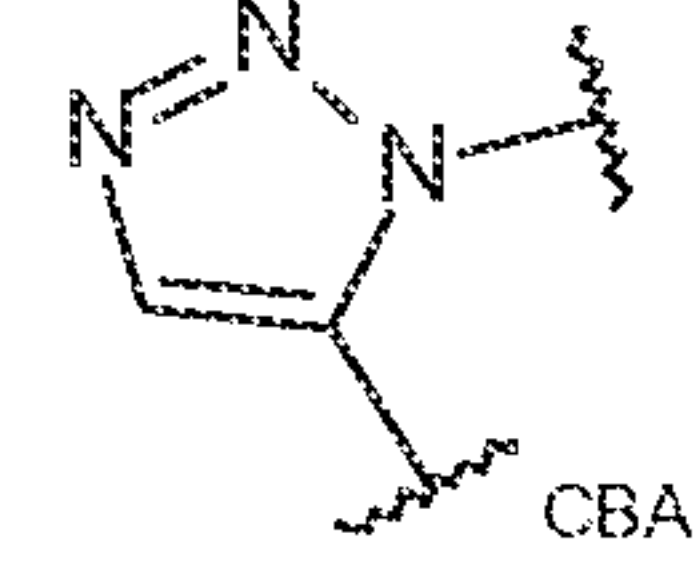

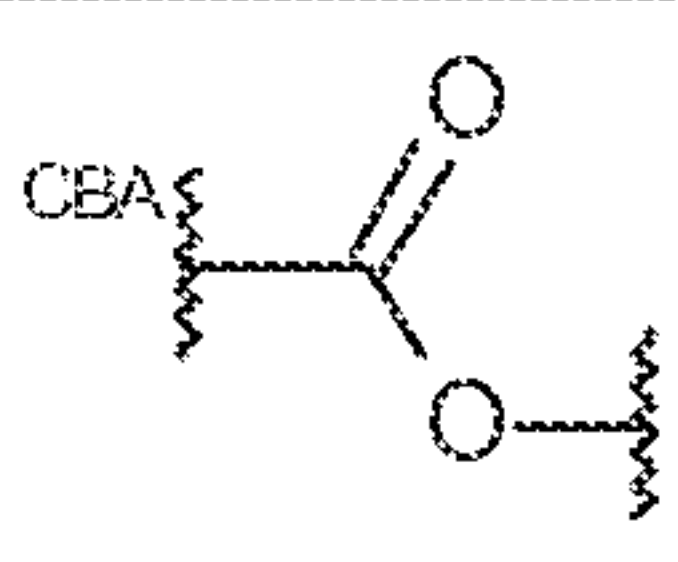

17. The conjugate according to any one of claims 1 to 15, wherein L is of formula:

where m is from 0 to 6; and

L^A is selected from:

(L ^{A1-1})		(L ^{A6})	
(L ^{A1-2})		(L ^{A7})	
(L ^{A2})		(L ^{A8-1})	
(L ^{A3-1})		(L ^{A8-2})	

(L ^{A3-2})		(L ^{A9-1})	
(L ^{A4})		(L ^{A9-2})	
(L ^{A5})			

where Ar represents a C₅₋₆ arylene group.

18. The conjugate of claim 17, wherein L^A is selected from L^{A1-1} and L^{A3-2}.
19. The conjugate according to either claim 17 or claim 18, wherein m is 2, 3 or 5.
20. The conjugate according to any one of claims 1 to 15, where L is of formula:
 $-L^A-(CH_2)_m-O-$ (L2)
 Where m is from 0 to 6; and
 L^A is selected from the groups as defined in claim 17.
21. The conjugate of claim 20, wherein L^A is L^{A3-2}.
22. The conjugate according to either claim 20 or 21, wherein m is 1.
23. The conjugate according to any one of claims 1 to 15, where L is of formula:
 $-L^A-(CH_2)_q-O-C(=O)-NH-(CH_2)_p-$ (L3)
 Where q is from 1 to 3, and p is from 1 to 3; and
 L^A is selected from the groups as defined in claim 17.
24. The conjugate of claim 23, wherein L^A is selected from L^{A7}, L^{A8-1} and L^{A8-2}.
25. The conjugate according to either claim 23 or 24, wherein q is 1.
26. The conjugate according to any one of claims 23 to 25, wherein p is 2.

27. The conjugate according to any one of claims 1 to 15, where L is of formula:

Where m is from 0 to 6;

X¹ and X² are amino acid groups, selected from natural amino acids, which may be modified;

L^A is selected from the groups as defined in claim 17.

28. The conjugate according to claim 27, wherein the group -X₁-X₂- is selected from:

-Phe-Lys-,

-Val-Ala-,

-Val-Lys-,

-Ala-Lys-,

-Val-Cit-.

29. The conjugate according to either claim 27 or claim 28, wherein m is 5.

30. The conjugate according to any one of claims 1 to 29, wherein n is an integer between 0 and 16.

31. The conjugate according to any one of claims 1 to 30, wherein n is an integer between 0 and 8.

32. The conjugate according to any one of claims 1 to 31, wherein n is 3 or 4.

33. The conjugate according to any one of claims 1 to 32, wherein the cell binding agent is an antibody or an active fragment thereof.

34. The conjugate according to claim 33, wherein the antibody or antibody fragment is an antibody or antibody fragment for a tumour-associated antigen.

35. The conjugate of claim 34 wherein the antibody or antibody fragment is an antibody which binds to one or more tumor-associated antigens or cell-surface receptors selected from (1)-(38):

- (1) BMPR1B (bone morphogenetic protein receptor-type IB);
- (2) E16 (LAT1, SLC7A5);
- (3) STEAP1 (six transmembrane epithelial antigen of prostate);
- (4) 0772P (CA125, MUC16);
- (5) MPF (MPF, MSLN, SMR, megakaryocyte potentiating factor, mesothelin);
- (6) Napi3b (NAPI-3B, Napi2b, NPTIib, SLC34A2, solute carrier family 34 (sodium phosphate), member 2, type II sodium-dependent phosphate transporter 3b);
- (7) Sema 5b (FLJ10372, KIAA1445, Mm.42015, SEMA5B, SEMAG, Semaphorin 5b Hlog, sema domain, seven thrombospondin repeats (type 1 and type 1-like), transmembrane domain (TM) and short cytoplasmic domain, (semaphorin) 5B);
- (8) PSCA hlg (2700050C12Rik, C530008O16Rik, RIKEN cDNA 2700050C12, RIKEN cDNA 2700050C12 gene);
- (9) ETBR (Endothelin type B receptor);
- (10) MSG783 (RNF124, hypothetical protein FLJ20315);
- (11) STEAP2 (HGNC_8639, IPCA-1, PCANAP1, STAMP1, STEAP2, STMP, prostate cancer associated gene 1, prostate cancer associated protein 1, six transmembrane epithelial antigen of prostate 2, six transmembrane prostate protein);
- (12) TrpM4 (BR22450, FLJ20041, TRPM4, TRPM4B, transient receptor potential cation channel, subfamily M, member 4);
- (13) CRIPTO (CR, CR1, CRGF, CRIPTO, TDGF1, teratocarcinoma-derived growth factor);
- (14) CD21 (CR2 (Complement receptor 2) or C3DR (C3d/Epstein Barr virus receptor) or Hs 73792);
- (15) CD79b (CD79B, CD79 β , Ig β (immunoglobulin-associated beta), B29);
- (16) FcRH2 (IFGP4, IRTA4, SPAP1A (SH2 domain containing phosphatase anchor protein 1a), SPAP1B, SPAP1C);
- (17) HER2;
- (18) NCA;
- (19) MDP;
- (20) IL20R α ;
- (21) Brevican;
- (22) EphB2R;
- (23) ASLG659;
- (24) PSCA;
- (25) GEDA;
- (26) BAFF-R (B cell -activating factor receptor, BlyS receptor 3, BR3);

- (27) CD22 (B-cell receptor CD22-B isoform);
- (28) CD79a (CD79A, CD79 α , immunoglobulin-associated alpha);
- (29) CXCR5 (Burkitt's lymphoma receptor 1);
- (30) HLA-DOB (Beta subunit of MHC class II molecule (Ia antigen));
- (31) P2X5 (Purinergic receptor P2X ligand-gated ion channel 5);
- (32) CD72 (B-cell differentiation antigen CD72, Lyb-2);
- (33) LY64 (Lymphocyte antigen 64 (RP105), type I membrane protein of the leucine rich repeat (LRR) family);
- (34) FcRH1 (Fc receptor-like protein 1);
- (35) IRTA2 (Immunoglobulin superfamily receptor translocation associated 2);
- (36) TENB2 (putative transmembrane proteoglycan);
- (37) CD33 (CD33 molecule, SIGLEC-3, SIGLEC3, p67; CD33 antigen (gp67); gp67; myeloid cell surface antigen CD33; sialic acid binding Ig-like lectin 3; sialic acid-binding Ig-like lectin); and
- (38) LGR5/GPR49.

36. The conjugate of claim 33 wherein the antibody or antibody fragment is a cysteine-engineered antibody.

37. The conjugate of either claim 33 or claim 36 wherein the antibody or antibody fragment is an antibody which binds to an ErbB receptor.

38. The conjugate of claim 37 wherein the antibody is trastuzumab.

39. The conjugate of either claim 33 or claim 36 wherein Ab is an anti-HER2, an anti-Steap1, or an anti-CD22 antibody.

40. The conjugate according to claim 33 wherein the drug loading (p) of drugs (D) to antibody (Ab) is an integer from 1 to about 8.

41. The conjugate according to claim 40, wherein p is 1, 2, 3, or 4.

42. The conjugate according to claim 41 comprising a mixture of the antibody-drug conjugate compounds, wherein the average drug loading per antibody in the mixture of antibody-drug conjugate compounds is about 2 to about 5.

43. The conjugate according to any one of claims 1 to 42, for use in therapy.
44. A pharmaceutical composition comprising the conjugate of any one of claims 1 to 42 a pharmaceutically acceptable diluent, carrier or excipient.
45. The conjugate according to any one of claims 1 to 42 or the pharmaceutical composition according to claim 44, for use in the treatment of a proliferative disease in a subject.
46. The conjugate according to claim 45, wherein the disease is cancer.
47. Use of a conjugate according to any one of claims 1 to 42 or a pharmaceutical according to claim 45 or 46 in a method of medical treatment.
48. A method of medical treatment comprising administering to a patient the pharmaceutical composition of claim 45 or claim 46.
49. The method of claim 48 wherein the method of medical treatment is for treating cancer.
50. The method of claim 49, wherein the patient is administered a chemotherapeutic agent, in combination with the conjugate.
51. Use of a compound according to any one of claims 1 to 42 in a method of manufacture of a medicament for the treatment of a proliferative disease.
52. A method of treating a mammal having a proliferative disease, comprising administering an effective amount of a compound according to any one of claims 1 to 42 or a pharmaceutical composition according to claim 45 or claim 46.

53. A compound of formula (B):

wherein:

R^2 , R^6 , R^7 , R^9 , R^{10} , R^{11} , R^{22} , R^{16} , R^{17} , R^{19} , R^{20} , R^{21} , Z, T, T', X and X' are as defined in any one of claims 1 to 15;

Y^L is selected from a group of formulae B1, B2, B3, B4, B5 and B6:

(B1)

(B2)

(B3)

(B4)

160

(B5)

(B6)

G is a reactive group for connecting to a cell binding agent

wherein n and R^{A4} are as defined in any one of claims 1 to 32.

54. The compound according to claim 53, wherein the group G contains an electrophilic group selected from (i) maleimide groups (ii) activated disulfides, (iii) active esters such as NHS (N-hydroxysuccinimide) esters, HOBT (N-hydroxybenzotriazole) esters, haloformates, and acid halides; (iv) alkyl and benzyl halides such as haloacetamides; and (v) aldehydes, ketones, carboxyl.

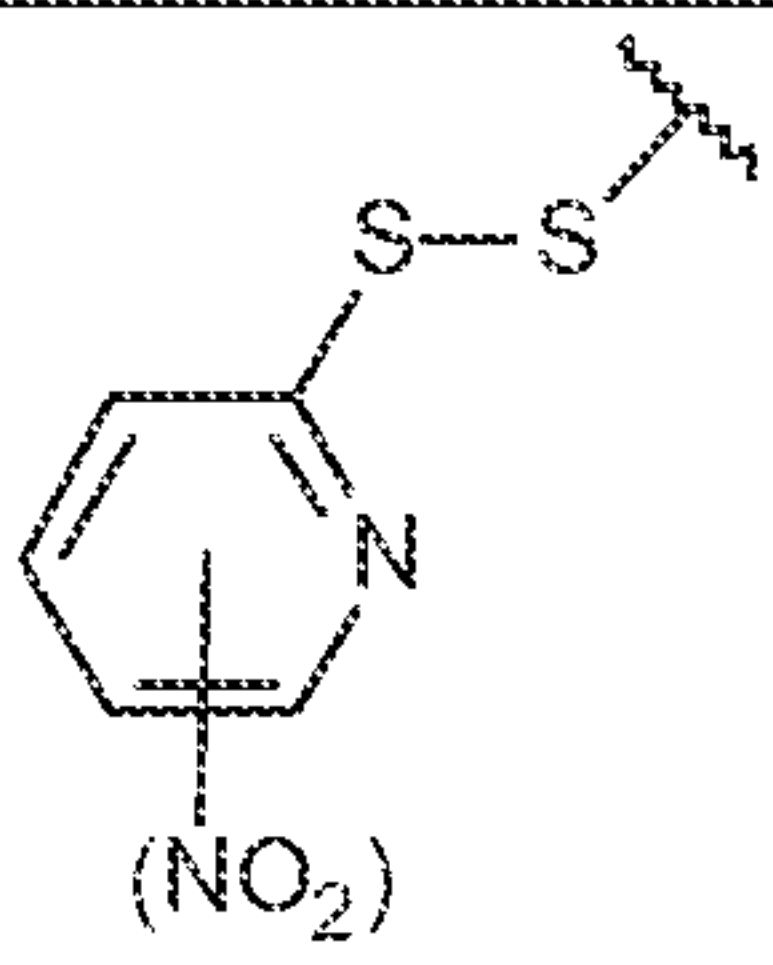

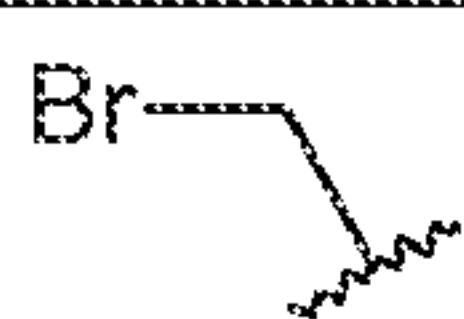

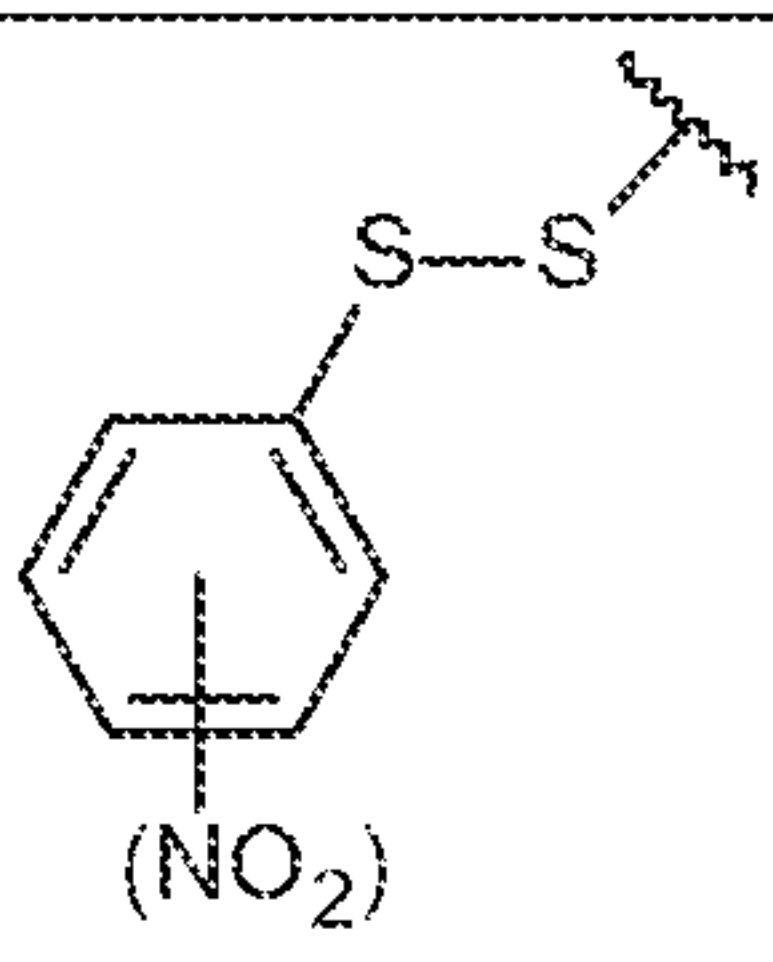

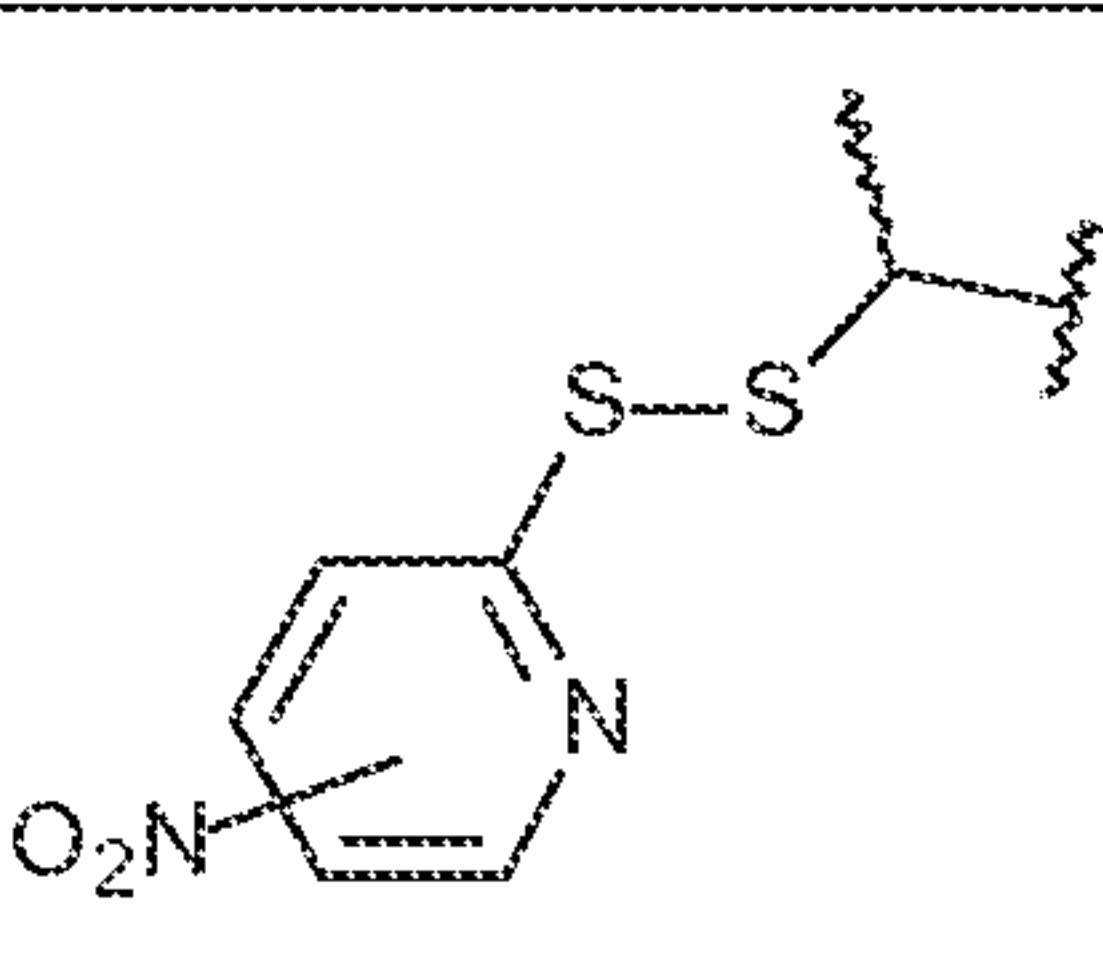

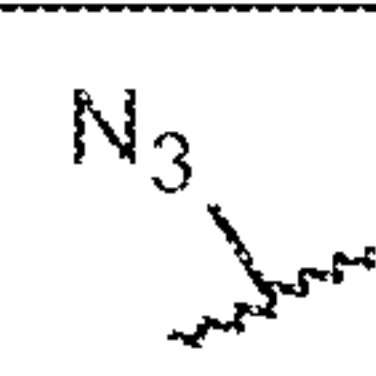

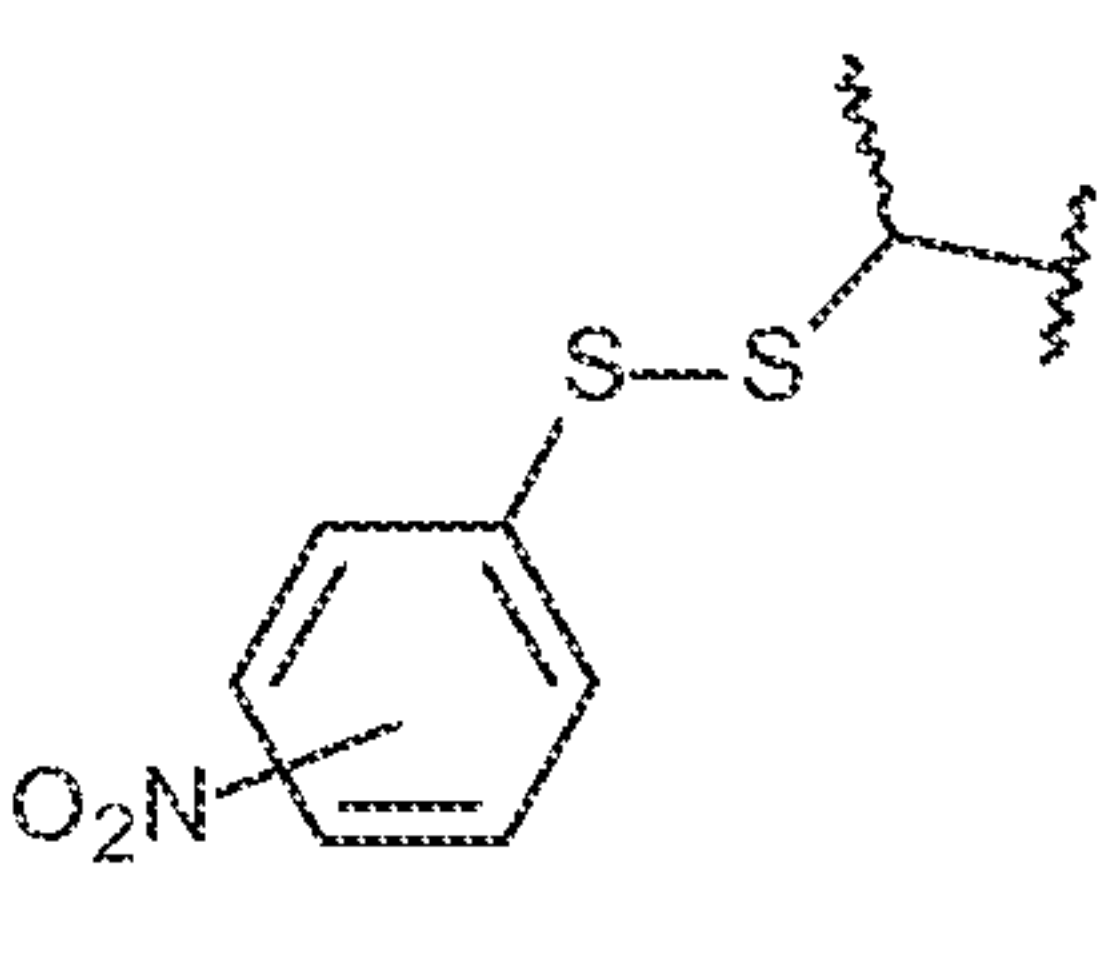

55. The compound according to either claim 53 or claim 54, wherein G is of formula:

where m is from 0 to 6; and

G^A is selected from:

(G ^{A1-1})		(G ^{A4})	
(G ^{A1-2})		(G ^{A5})	
(G ^{A2})		(G ^{A6})	

(G ^{A3-1})	 <p>where the NO₂ group is optional</p>	(G ^{A7})	
(G ^{A3-2})	 <p>where the NO₂ group is optional</p>	(G ^{A8})	
(G ^{A3-3})	 <p>where the NO₂ group is optional</p>	(G ^{A9})	
(G ^{A3-4})	 <p>where the NO₂ group is optional</p>		

where Ar represents a C₅₋₆ arylene group.

56. The compound of claim 45, wherein G^A is selected from G^{A1-1} and G^{A3-3}.

57. The compound according to either claim 55 or claim 56, wherein m is 2, 3 or 5.

58. The compound according to either claim 53 or claim 54, where G is of formula:

Where m is from 0 to 6; and

G^A is as defined in claim 55.

59. The compound of claim 58, wherein G^A is G^{A3-2}.

60. The compound according to either claim 58 or 59, wherein m is 1.

61. The compound according to either claim 53 or claim 54, where G is of formula:

Where q is from 1 to 3, and p is from 1 to 3; and

G^A is as defined in claim 55.

62. The compound of claim 61, wherein G^A is selected from G^{A7} and G^{A8} .

63. The compound according to either claim 61 or 62, wherein q is 1.

64. The compound according to any one of claims 61 to 63, wherein p is 2.

65. The compound according to either claim 53 or claim 54, where G is of formula:

Where m is from 0 to 6;

X^1 and X^2 are amino acid groups, selected from natural amino acids, which may be modified;
and

G^A is as defined in claim 55.

66. The compound according to claim 65 wherein m is 5.

67. A compound of formula (C):

wherein:

R^2 , R^6 , R^7 , R^9 , R^{22} , R^{16} , R^{17} , R^{19} , Z, T, T', X and X' are as defined in any one of claims 1 to 15;

Y^C is selected from a group of formulae C1, C2, C3, C4, C5 and C6:

(C1)

(C2)

(C3)

(C4)

(C5)

(C6)

wherein n and R^{A4} are as defined in any one of claims 1 to 32;

either

- (a) R^{30} is H, and R^{31} is OH, OR^A , where R^A is C_{1-4} alkyl; or
- (b) R^{30} and R^{31} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound; or
- (c) R^{30} is H and R^{31} is OSO_2M , where z is 2 or 3 and M is a monovalent pharmaceutically acceptable cation; or
- (d) R^{30} is a nitrogen protecting group and R^{31} is $OProt^O$, where $Prot^O$ is a hydroxy protecting group; and

R^{40} and R^{41} are as defined for R^{30} and R^{31} respectively.

68. The compound according to claim 67, wherein R^{30} is H, and R^{31} is OH.

69. The compound according to claim 67, wherein R^{30} and R^{41} form a nitrogen-carbon double bond between the nitrogen and carbon atoms to which they are bound.

70. The compound according to claim 67, wherein R^{30} is a nitrogen protecting group and R^{31} is OProt^O, where Prot^O is a hydroxyl protecting group.

71. The compound according to claim 70, wherein the nitrogen protecting group is Boc.

72. The compound according to either claim 70 or claim 71, wherein the hydroxyl protecting group is THP.

73. A compound of formula (D):

wherein:

R^2 , R^6 , R^7 , R^9 , R^{22} , R^{16} , R^{17} , R^{19} , Z, T, T', X and X' are as defined in any one of claims 1 to 15;

R^{30} , R^{31} , R^{40} and R^{41} are as defined in any one of claims 47 to 52;

Y^D is selected from a group of formulae D2, D3, D4 and D6:

(D2)

(D3)

165

(D4)

(D6)

wherein R^{A4} are as defined in any one of claims 1 to 32.

74. A compound of formula (E):

wherein:

R^2 , R^6 , R^7 , R^9 , R^{22} , R^{16} , R^{17} , R^{19} , Z , T , T' , X and X' are as defined in any one of claims 1 to 15;

R^{30} , R^{31} , R^{40} and R^{41} are as defined in any one of claims 67 to 72;

Y^E is selected from a group of formulae E1, E2 and E5:

(E1)

(E2)

(E5)

where

R^{E1} is selected from H and TMS; and

R^{E2} is selected from Br, Cl and I.

75. A method of synthesis of a compound according to any one of claims 1 to 52, comprising the step of conjugating a drug-linker according to any one of claims 53 to 66 with a cell-binding agent.
