Description

[Technical field]

[0001] The present disclosure relates to a heteroaryl derivative compound and medicinal uses thereof. Specifically, the present disclosure relates to a heteroaryl derivative compound having EGFR and/or HER2 inhibitory activity.

[Background Art]

[0002] Protein kinases are involved in signaling pathways by acting as molecular switches, and the transition between the activity and inactivity of the target protein by kinase in the cell must be smoothly regulated. If the transition between the active and inactive states is abnormally regulated, intracellular signal transmission is excessively activated or deactivated, leading to uncontrollable cell division and proliferation. In particular, abnormal activation by mutation, amplification and/or overexpression of protein kinase genes causes the development and progression of various tumors or plays a decisive role in the onset of various diseases such as inflammatory diseases, degenerative brain diseases, and autoimmune diseases, and the like.

[0003] An epidermal growth factor receptor (EGFR), a receptor tyrosine kinase in the ErbB family, is abnormally active in many epithelial cell tumors, including non-small cell lung cancer (NSCLC), breast cancer, glioma, squamous cell carcinoma of the head and neck, colorectal cancer, rectal adenocarcinoma, head and neck cancer, gastric and prostate cancer. It has been known that the activation of the EGFR-tyrosine kinase causes continuous cell proliferation, invasion into surrounding tissues, remote metastasis, and angiogenesis, and increases cell survival.

[0004] In addition, EGFR Del19 or EGFR L858R, an EGFR mutation, has been known to be a major cause of non-small cell lung cancer and head and neck cancer, and Iressa and Tarceva, which are therapeutic agents for these mutations, have been developed and are currently being used in clinical practice. However, when these drugs were used in patients, acquired resistance that caused EGFR secondary mutations based on the structure of the drug was observed, and it was also found that this is a real major cause of drug resistance. When the first-generation EGFR inhibitors are used for an average of about 10 months, acquired resistance called the T790M mutation located in the gatekeeper of the EGFR kinase occurs, and thus the first-generation EGFR inhibitors are not effective. In other words, EGFR Del19/T790M or EGFR L858R/T790M double mutation occurs, which prevents existing therapeutic agents from exhibiting drug efficacy. Osimertinib, a third-generation EGFR-TKI target drug that exhibits high reactivity to drug resistance according to EGFR T790M mutation, has been developed, but it has also been reported to cause drug resistance (Niederst MJ. et al., Clin Cancer Res, 2015, 17(21):3924-3933). EGFR C797S mutation has been suggested as one of the main mechanisms causing drug resistance to osimertinib, and it has been reported that about 40% of clinical trial patients have EGFR C797S mutation (Thress KS. et al., Nature Medicine, 2015, 21:560-562). Thus, EGFR Del19/C797S (EGFR DC) or EGFR L858R/C797S (EGFR LC) may be the main target.

[0005] Further, L861Q, G719A, S768I, L718Q, G724S, or the like, expressing EGFR rare (or uncommon) and drug-resistant mutations may also be potential targets.

[0006] Meanwhile, HER2 (human epidermal growth factor receptor 2; also called ErbB2), which is a receptor tyrosine kinase of the ErbB family, forms homodimers or heterodimers with other EGFR receptors, HER1 (EGFR, ErbB1), HER3 (ErbB3) or HER4 (ErbB4), and is activated by autophosphorylation at intracellular tyrosine residues, which plays an important role in cell proliferation, differentiation and survival in normal cells and cancer cells (Di Fiore PP. et al., Science. 1987, 237(481):178-182). HER2 is known to be overexpressed in several carcinomas such as breast, gastric and ovarian cancer (Hardwick RH. et al., Eur. J Surg Oncol. 1997, 23(1) :30-35; Korkaya H. et al., Oncogene. 2008, 27(47):6120-6130;).

[0007] As described above, there is an increasing unmet need for a novel compound that is capable of being usefully employed for the treatment of EGFR- and/or HER2-related diseases by regulating EGFR activities (particularly C797S mutations such as EGFR Del19/C797S and EGFR L858R/C797S, EGFR rare mutations, drug resistance mutations, or the like) and/or HER2.

[Disclosure]

[Technical Problem]

[0008] An object of the present disclosure is to provide a heteroaryl derivative having a novel structure, an optical isomer thereof, or a pharmaceutically acceptable salt thereof.

[0009] Another object of the present disclosure is to provide a method for preparing the heteroaryl derivative compound.

[0010] Still another object of the present disclosure is to provide a pharmaceutical use of the heteroaryl derivative compound, and specifically, to a pharmaceutical composition for the treatment or prevention of EGFR- and/or HER2-

related diseases comprising the heteroaryl derivative compound as an active ingredient, use of the compound for the treatment or prevention of EGFR- and/or HER2-related diseases, or a method for treating or preventing EGFR- and/or HER2-related diseases comprising administering the compound.

[Technical Solution]

[0011] In order to achieve the above-described objects, the present inventors made efforts to study, and as a result, found that the following heteroaryl derivative compounds represented by Chemical Formula 1 inhibited the proliferation of EGFR- and/or HER2-activated cells, and completed the present disclosure.

[0082] Tert-butyl hydroxycarbamate (50.4 g, 378.52 mmol, 1.05 eq.) was dissolved in dimethylformamide (DMF; 500 mL), and then sodium hydride (NaH; 15.86 g, 396.55 mmol, 60% purity, 1.1 eq.) was added at 0°C under a nitrogen atmosphere. The reaction mixture was stirred at 10°C for 1 hour, and (S)-3-chloro-1-(3-fluorophenyl)propan-1-ol (68 g, 360.5 mmol, 1 eq.) obtained in step 4 above diluted in dimethylformamide (DMF; 180 mL) was added dropwise at 0°C and stirred at 10°C for 16 hours. As a result of TLC analysis (petroleum ether (PE): ethyl acetate (EA) = 2:1), all of the starting materials disappeared, and the title compound was detected. After the reaction was terminated by adding an aqueous ammonium chloride solution (3 L), the organic layer was extracted using ethyl acetate (2000 mL) and brine (2000 mL). The organic layer was dried over sodium sulfate and concentrated under reduced pressure to obtain the title compound as a light yellow solid (176 g, 616.87 mmol, 85.56% yield).

[0157] 3-Bromo-5-fluorobenzoic acid (10 g, 1 eq.) was dissolved in dichloromethane (110 mL), and then N,O-dimethylhydroxylamine hydrochloride (5.4 g, 1.2 eq.), triethylamine (TEA; 5.7 mL, 0.9 eq.), and 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide (EDCI; 11.5 g, 1.2 eq.) were added sequentially at room temperature. The reaction mixture was stirred at room temperature for 3 hours. As a result of TLC analysis (dichloromethane), all of the starting materials disappeared and a new spot with low polarity was detected. The organic layer was extracted using ethyl acetate (EA; 300 mL) and a saturated aqueous sodium hydrogen carbonate solution (400 mL * 2). The organic layer was dried over sodium sulfate and concentrated under reduced pressure to obtain the title compound as a yellow oil (11.2 g, 94.0% yield).

Step 2: Preparation of 1-(3-bromo-5-fluorophenyl)prop-2-en-1-one

[0158] 3-Bromo-5-fluoro-N-methoxy-N-methylbenzamide (11.2 g, 1 eq.) obtained in step 1 was dissolved in tetrahydrofuran (THF; 220 mL), and then bromo(vinyl)magnesium (0.7M, 93 mL, 1.5 eq.) was added dropwise at 0°C. Next, the reaction mixture was stirred at 0°C for 1 hour. As a result of TLC analysis (hexane:dichloromethane = 1:1), all of the starting materials disappeared and a new spot with low polarity was detected. The reaction was terminated by adding hydrochloric acid (1N, 50 mL), and then the organic layer was extracted using ethyl acetate (EA; 300 mL) and hydrochloric acid (1N, 400 mL * 2). The organic layer was dried over sodium sulfate, and then concentrated under reduced pressure. The concentrated compound was purified by chromatography (hexane:dichloromethane = 1:1) to obtain the title compound as a colorless oil (7.9 g, 76% yield).

Step 3: Preparation of 1-(3-bromo-5-fluorophenyl)-3-chloropropan-1-one

The reaction mixture was stirred at 0°C for 2 hours. As a result of TLC analysis (hexane:dichloromethane = 1:1), all of the starting materials disappeared, and a spot of the title compound was detected. The reaction was terminated by adding methanol (20 mL) at 20°C, and then the solvent was distilled off under reduced pressure. The concentrated compound was treated with ethyl acetate (EA; 300 mL) and hydrochloric acid (1N, 400 mL * 2) to extract the organic layer. <Experimental Example 1> Evaluation of proliferation inhibitory activity of EGFR mutant overexpression Ba/F3 cell

[0180] The following experiments were performed to evaluate the inhibitory activity of the compounds according to the present disclosure on Ba/F3 proliferation expressing EGFR C797S, L861Q, G719A, S768I, L718Q, and/or G724S

mutations.

[0181] For Ba/F3 cells, RPMI-1640 containing 10% FBS and 5 ng/ml IL-3 (R&D Systems) was used. Transduced Ba/F3 cells were cultured after adding 1 ug/ml puromycin (Invitrogen) to the same medium.

[0182] At 24 hours before treatment with the compounds, 3000 to 5000 cells were aliquoted into each well of a white clear bottom 96 well plate (Corning). The compounds were diluted in dimethyl sulfoxide (3 times dilution, 12 concentrations in total), and injected in an amount of 1 μl so that the final concentration was 0.2 nM to 5 uM. For measurement of living cells, after 72 hours of compound treatment, the cells were stored at room temperature for 10 min using CellTiter-Glo luminescentcell-viability reagent (Promega), and then luminescence intensity was measured using a reader (Synergy-Neo, Biotek). Each test was repeated three times. Result values were calculated as the cell growth rate (%) compared to the control. The graphs were created using GraphPad Prism version 8.3.0 program and the GI_{50} values were calculated.

[0183] Table 2 below shows the evaluation results of the proliferation inhibitory activity of Ba/F3 cells expressing EGFR Del19/C797S (EGFR DC) and EGFR L858R/C797S (EGFR LC) mutations.
