(57) Abstract: The present invention relates to pyridazinone derivatives of general formula (I), wherein the groups A, G and R¹ are as defined in the application, the tautomers thereof, stereoisomers thereof, the mixtures thereof and the salts thereof, which have valuable pharmacological properties, and in particular bind to the GPR119 receptor and modulate its activity.

WO 2011/138427 A2

Pyridazinones as GPR119 agonists

- 5 The present invention relates to pyridazinone derivatives of general formula I

wherein the groups A, G and R¹ are defined as hereinafter, including the tautomers thereof, stereoisomers (e.g. diastereomers and enantiomers), the mixtures thereof and the salts thereof, particularly the pharmaceutically acceptable salts thereof, which have valuable pharmacological properties, in particular they bind to the G-protein-coupled receptor GPR119 (also known as GPCR2, RUP3, SNORF25 or GDIR) and modulate its activity.

These compounds according to the invention may be used in the pharmaceutical industry for preparing pharmaceutical compositions for human and/or veterinary medicine.

The invention further relates to pharmaceutical compositions containing one or more compounds according to the invention as well as the use of the compounds according to the invention as medicaments, particularly for preparing pharmaceutical compositions for the therapeutic treatment of metabolic disorders, particularly obesity and diabetes, especially type 2 diabetes, and the complications thereof and/or associated diseases. In addition, the invention relates to processes for preparing the compounds and pharmaceutical compositions according to the invention.

Diabetes mellitus is a serious metabolic disease which affects more than 100 million people worldwide. In the USA there are more than 12 million diabetics with 600,000 new cases diagnosed every year. The prevalence of diabetes mellitus is on the increase, which means in particular a high frequency of complications as well, leading to a substantial impairment of quality of life and life expectancy. Because of diabetes-associated microvascular

complications, in the industrialised countries type 2 diabetes is currently the most common cause of adult-onset loss of vision, renal insufficiency and amputations. In addition, type 2 diabetes is associated with a two- to five-fold increase in the risk of cardiovascular disease.

- 5 The UKPDS study (United Kingdom Prospective Diabetes Study) showed that intensive treatment with common therapeutic agents, e.g. metformin, sulphonylureas or insulin, results in only a limited improvement in glycaemic control (difference in the HbA1c value ~ 0.9%). Moreover, glycaemic control deteriorated considerably over time even in patients in the intensive treatment group, and this was put down to a deterioration in beta cell function.
- 10 Diabetes is also a major cause of damage to the retina at the back of the eye and increases the risk of cataract and glaucoma. Finally, diabetes is associated with nerve damage, particularly in the legs and feet, which affects the patient's ability to feel pain and contributes to serious infections. All in all, complications of diabetes are one of the major causes of death worldwide.

15

Adiposity (obesity) is the result of an imbalance between calorie intake and energy consumption. It correlates to a high degree with insulin resistance and diabetes. However, the molecular mechanisms that are involved in obesity/diabetes syndromes are not yet clear. At an early stage of the development of obesity, an increased insulin secretion balances out the insulin resistance and protects the patient from hyperglycaemia. However, after a time,

20 the beta cell function worsens and non-insulin-dependent diabetes develops in about 20% of the obese population. Obesity has thus become a critical risk factor for diabetes, but the factors that predispose one group of patients to a pathological change in insulin secretion as a response to the accumulation of fat are currently unknown.

25

Obesity also significantly increases the risk of the development of cardiovascular disease. Diabetes is also implicated in the formation of kidney complaints, eye complaints and problems of the nervous system. Kidney disease, also known as nephropathy, sets in when the filtering mechanism of the kidneys is disrupted and proteins escape into the urine in excessive amounts and finally the kidney fails. Therefore there is a medical need for

30 medicaments for preventing and/or treating metabolic disorders (particularly diabetes, predominantly type 2 diabetes) and the complications thereof. In particular there is a need for medicaments with good activity in terms of glycaemic control, disease-modifying properties and reducing cardiovascular morbidity and mortality, and which also have a better safety profile.

3

GPR119 is a Gs-protein coupled receptor which is expressed overwhelmingly in the beta cells of the pancreas and in the L cells of the bowel. Activation of the receptor stimulates the cAMP signal pathway, in the way that GLP-1R agonists do. Therefore, a GPR119 agonist can be expected to bring about an improvement in the beta cell function and the beta cell mass. In fact, activation of GPR119 stimulates insulin secretion in-vitro and in-vivo (in rodents) in a glucose-dependent manner. It has recently been shown that GPR agonists effectively lower the blood glucose level in diabetic rodents without the risk of hypoglycaemia. In addition, GPR119 expression has been observed in the gastrointestinal tract and in the brain of rodents, but not in the human brain. It was shown that the activation of GPR119 in neuroendocrine cells of the bowel stimulates the release of GLP-1, therefore the activation of GPR119 combines a direct effect on the beta cells with an indirect glucoregulatory effect through an intestinal increase in the release of GLP-1. Therefore the GPR119 agonists may be expected to have a therapeutic benefit in metabolic diseases. Examples of such diseases include type 1 diabetes, type 2 diabetes, insufficient glucose tolerance, insulin resistance, hyperglycaemia, hyperlipidaemia, hypercholesterolaemia, dyslipidaemia, syndrome X, metabolic syndrome, obesity, high blood pressure, chronic systemic inflammation, retinopathy, neuropathy, nephropathy, atherosclerosis, endothelial dysfunction and bone-related diseases (such as osteoporosis, rheumatoid arthritis or osteoarthritis).

20

The publication EP 0196005 describes certain pyridazinone derivatives and their medical use based on a cardiotoxic and/or hypotensive and antithrombotic activity.

It has now been found that the compounds according to the invention described in more detail hereinafter have surprising and particularly advantageous properties, and in particular may be used as GPR119 agonists.

Heterocyclyl for the purposes of the present invention may also encompass mono- or polysubstituted oxo-substituted (e.g. mono- or di-oxo-substituted) derivatives of the heterocyclyl ring systems mentioned herein, such as e.g. systems in which one or more CH₂ groups are replaced by C=O, such as e.g. pyrrolidinone or piperidinone.

The oxo substituent for the purposes of the invention denotes a mono- or polysubstituted bound oxygen (e.g. =O) which is bound to a carbon atom or a heteroatom (e.g. N or S), in order to form for example a carbonyl group (C=O), an N-oxide, an S-oxide or an S,S-dioxide.

The heteroaryl or heterocyclyl groups specified, unless stated otherwise, encompass all the possible isomeric forms (e.g. tautomers, positional isomers, etc.). Generally speaking, for groups that have two or more sub-groups, the last-mentioned subgroup is the point of attachment of the group, for example the substituent aryl-1-nC-alkyl denotes an aryl group which is bound to an 1-nC-alkyl group, while the latter is bound to the nucleus or to the group to which the substituent is attached.

5

Unless stated otherwise, the substituents, groups, residues or fragments mentioned herein may be linked or bound via any possible position.

For example, unless stated otherwise, the aryl, heteroaryl or heterocyclyl groups specified herein may be attached to their neighbouring group(s) via any suitable cyclic carbon or cyclic

10

nitrogen atom. Moreover, unless stated otherwise, the heteroaryl or heterocyclyl groups mentioned herein that have one or more substituents may carry their substituents at any desired possible position, i.e. any suitable cyclic carbon or cyclic nitrogen atom.

15

Moreover, unless stated otherwise, the phenyl groups mentioned herein that have one or more substituents may carry their substituents in each case in the ortho, meta or para position relative to the point of attachment at which the phenyl group is attached to its neighbouring group.

20

- 5 Salts that are not pharmaceutically acceptable, which may be obtained for example as process products during the preparation of the compounds according to the invention, are converted into pharmaceutically acceptable salts using methods familiar to the skilled man.

10 All the isomeric forms, particularly all the regio- and stereoisomeric forms, e.g. all the chiral, enantiomeric, diastereomeric, racemic forms, tautomeric (e.g. keto/enol tautomeric), positional isomeric and all the geometric isomeric (e.g. cis/trans isomeric) forms, of a compound of formula I, or of a salt thereof, are considered within the scope of the present invention, if the specific isomeric form is not individually stated. Naturally, the preferred isomer is the one that is most effective and most free from side effects.

15

If for example the compounds according to the invention, independently of the substituents, have at least one asymmetrically substituted carbon atom, they may be isolated in optically active (e.g. as dextro- or laevo-rotatory antipodes) or in racemic form, e.g. as pure enantiomers in the R or S configuration in each case or as mixtures thereof in any mixing ratio (including in racemic form), and if they have at least two asymmetrically substituted carbon atoms, they may be isolated as pure diastereomers or as diastereoisomeric mixtures in optically active or racemic form.

25 The present invention encompasses all the possible region- and stereoisomers, particularly the diastereomers and enantiomers mentioned herein, e.g. in substantially pure form, in concentrated form (e.g. substantially free from one or all other unwanted diastereomers and/or enantiomers) and/or in any mixing ratio, including the racemic forms, and the salts thereof.

5 The compounds of formula I according to the invention are GPR119 agonists. The effect of the compounds on the activation of GPR119 and on the stimulation of intracellular cAMP concentration is determined using the AlphaScreen cAMP Assay Kit (Cat.No.# 6760625R) made by PerkinElmer.

10 MIN6 cells [Miyazaki J et al. Endocrinology. 1990 Jul;127(1):126-32] were stably transfected with an expression vector for human GPR119 cDNA (Acc. No. NP_848566). Min-6/hGPR119 cells are cultured in DMEM, 10% FBS, 50µM β-mercaptoethanol, 0.3mg/mL Genitacin, 2mM GlutaMAX at 37°C 5% CO₂. For the assay, the cells are placed in Optiplates

(white, 384-well, 160W- barcoded, TC, sterile with lid, Cat.No.# 6007688 (Perkin Elmer); 10000 cells/well; 50µl). The plates covered with lids are then incubated for 24 hours at 37°C / 5% CO₂.

After the medium has been sucked out of the wells completely, 10 µl of the test compound
 5 are added, the compounds are diluted beforehand with stimulating buffer (140mM NaCl, 3.6mM KCl, 0.5mM NaH₂PO₄, 0.5mM MgSO₄, 1.5mM CaCl₂, 10mM Hepes, 5mM NaHCO₃; pH 7.4. 0.5mM IBMX and 0.1% BSA, the final DMSO concentration is 1%). After 45 minutes' incubation at RT, the cAMP concentrations are determined using the
 AlphaScreen cAMP Assay Kit (Cat.No.# 6760625R from PerkinElmer). 10 µl of Biotin-cAMP
 10 (final concentration 1U/well in lysing buffer (5mM Hepes (pH 7.4), 0.1% BSA, 0.5% Tween) and 10µL Bead solution (final concentration 1 U/well in lysing buffer) are added. The plates are incubated for a further 2 hours at 24°C. The cAMP concentrations are calculated using a cAMP standard curve from the Alpha Screen Counts. The data analysis is carried out by calculating the EC₅₀ value and the maximum value based on a positive control, using
 15 suitable software (Prism). The compounds according to the invention increase the intracellular cAMP level by roughly a factor of 5.

The compounds according to the invention typically have EC₅₀ values in the range from about 20 nM to about 10 µM, preferably from 20 nM to 2 µM, preferably less than 1 µM,
 20 particularly preferably less than 500 nM, most particularly preferably less than 100 nM.

EC₅₀ values for representative compounds according to the invention are shown in the following Table (the number of the compound corresponds to the number of the Example in the experimental section):

The compounds of formula I and the physiologically acceptable salts thereof according to the invention have valuable pharmacological properties which make them commercially useful. Thus, for example, these compounds may act as GPR119 agonists.

In view of their ability to act as GPR119 agonists, the compounds of formula I according to the invention and the corresponding pharmaceutically acceptable salts thereof are theoretically suitable for treating and/or preventatively treating all those conditions or diseases that can be influenced by binding to the G-protein coupled receptor GPR119 and by modulation of its activity. Therefore the compounds according to the invention are suitable for the prevention or treatment of diseases, particularly metabolic disorders, or conditions such as type 1 and type 2 diabetes mellitus, complications of diabetes (such as e.g. retinopathy, nephropathy or neuropathies, diabetic foot, ulcers or macroangiopathies), metabolic acidosis or ketosis, reactive hypoglycaemia, hyperinsulinaemia, glucose metabolic disorder, insulin resistance, metabolic syndrome, dyslipidaemias of different origins, atherosclerosis and related diseases, obesity, high blood pressure, chronic heart failure, oedema and hyperuricaemia. These substances are also suitable for preventing beta-cell degeneration such as e.g. apoptosis or necrosis of pancreatic beta cells. The substances are also suitable for improving or restoring the functionality of pancreatic cells, and also for increasing the number and size of pancreatic beta cells.

In addition the compounds according to the invention are suitable for use in one or more of the following therapeutic processes:

- 5 - for preventing, delaying, slowing the progression of or treating metabolic diseases, such as for example type 1 diabetes, type 2 diabetes, insufficient glucose tolerance, insulin resistance, hyperglycaemia, hyperlipidaemia, hypercholesterolaemia, dyslipidaemia, syndrome X, metabolic syndrome, obesity, high blood pressure, chronic systemic inflammation, retinopathy, neuropathy, nephropathy, atherosclerosis, endothelial dysfunction or bone-related diseases (such as osteoporosis, rheumatoid arthritis or osteoarthritis);
- 10 - for improving glycaemic control and/or reducing fasting plasma glucose, postprandial plasma glucose and/or the glycosylated haemoglobin HbA1c;
- for preventing, delaying, slowing or reversing the progression of disrupted glucose tolerance, insulin resistance and/or metabolic syndrome to type 2 diabetes;
- for preventing, delaying, slowing the progression of or treating a condition or a disease 15 selected from among the complications of diabetes, such as for example retinopathy, nephropathy or neuropathies, diabetic foot, ulcers or macroangiopathies;
- for reducing weight or preventing weight gain or assisting weight loss;
- for preventing or treating the degradation of pancreatic beta cells and/or improving and/or restoring the functionality of pancreatic beta cells and/or restoring the functionality of 20 pancreatic insulin secretion;
- for maintaining and/or improving insulin sensitivity and/or preventing or treating hyperinsulinaemia and/or insulin resistance.

In particular, the compounds according to the invention, including the physiologically 25 acceptable salts thereof, are suitable for the prevention and/or treatment of obesity, diabetes (comprising type 1 and type 2 diabetes, preferably type 2 diabetes mellitus) and/or complications of diabetes (such as for example retinopathy, nephropathy or neuropathies, diabetic foot, ulcers or macroangiopathies).

30 The compounds according to the invention, including the physiologically acceptable salts thereof, are most particularly suitable for treating type 2 diabetes mellitus.

The dosage required to achieve the corresponding activity for treatment or prevention usually depends on the compound which is to be administered, the patient, the nature and gravity of 35 the illness or condition and the method and frequency of administration and is for the patient's doctor to decide. Expediently, the dosage may be from 0.1 to 100 mg, preferably 0.5 to 50 mg, by intravenous route, and 1 to 1000 mg, preferably 1 to 100 mg, by oral route,

in each case administered 1 to 4 times a day. For this purpose, the compounds according to the invention may be formulated, optionally together with other active substances, together with one or more inert conventional carriers and/or diluents, e.g. with corn starch, lactose, glucose, microcrystalline cellulose, magnesium stearate, polyvinylpyrrolidone, citric acid, tartaric acid, water, water/ethanol, water/glycerol, water/sorbitol, water/polyethylene glycol, propylene glycol, cetylstearyl alcohol, carboxymethylcellulose or fatty substances such as hard fat or suitable mixtures thereof, to produce conventional galenic preparations such as plain or coated tablets, capsules, powders, suspensions or suppositories.

10 The compounds according to the invention may be administered by oral, transdermal, inhalative, parenteral or sublingual route. Of the possible methods of administration, oral or intravenous administration is preferred. The compounds according to the invention are present as active ingredients in the formulations conventionally used for this purpose, such as those mentioned above, for example. Oral formulations, particularly solid forms such as e.g. tablets or capsules are preferred.

The pharmaceutical preparations or formulations according to the invention contain at least one compound according to the invention (= active substance) for example in an amount of 0.1 to 99.9 percent by weight, or 5 to 95 percent by weight, or 20 to 80 percent by weight, optionally together with pharmaceutically acceptable excipients (comprising for example diluents, carriers, binders, disintegrants and/or other excipients).

The particular excipients, carriers and/or diluents that are suitable for the desired preparations will be familiar to the skilled man on the basis of his specialist knowledge. The preferred ones are those that are suitable for the particular formulation and method of administration that are desired. The preparations or formulations according to the invention may be prepared using methods known *per se* that are familiar to the skilled man, such as for example by mixing or combining at least one compound of formula I according to the invention, or a pharmaceutically acceptable salt of such a compound, and one or more excipients, carriers and/or diluents.

In addition to being used in monotherapy, the compounds according to the invention may also be used in conjunction with one or more other active substances, particularly for the treatment and/or prevention of the diseases and conditions mentioned above. Other active substances which are suitable for such combinations include in particular those which for example potentiate the therapeutic effect of one or more active substances with respect to

one of the indications mentioned and/or which allow the dosage of one or more active substances to be reduced.

Therapeutic agents which are suitable for such a combination include, for example, antidiabetic agents such as metformin, sulphonylureas (e.g. glibenclamide, tolbutamide, glimepiride), nateglinide, repaglinide, thiazolidinediones (e.g. rosiglitazone, pioglitazone), PPAR-(alpha, gamma or alpha/gamma) agonists or modulators (e.g. aleglitazar, indeglitazar), alpha-glucosidase inhibitors (e.g. miglitol, acarbose, voglibose), DPPIV inhibitors (e.g. sitagliptin, vildagliptin, saxagliptin, alogliptin, linagliptin), SGLT2-inhibitors (e.g. dapagliflozin, sergliflozin), insulin and insulin analogues, GLP-1 and GLP-1 analogues (e.g. exenatide, liraglutide, taspoglutide) or amylin and amylin analogues, cycloset, 11- β -HSD inhibitors or GPR119 agonists. For example, hydroxyl, primary or secondary amino, or thiol groups may be converted by alkylation into optionally substituted alkoxy, mono- or dialkylamino, or alkylsulphonyl groups. This transformation is carried out by reaction with a suitable alkylating agent, such as e.g. an

10 trifluoromethanesulphonate in the presence of a suitable base, such as e.g. sodium hydride, potassium carbonate, potassium hexamethyldisilazide, in a suitable solvent, such as e.g. diethyl ether, 1,4-dioxane, tetrahydrofuran, N,N-dimethylformamide, toluene or acetonitrile, at a suitable reaction temperature, such as e.g. in the range from -50°C to 80°C, preferably -20°C to 50°C.

15 Accordingly, haloalkyl groups, particularly chloroalkyl or bromoalkyl groups, may be converted analogously or in similar fashion by a reaction of nucleophilic substitution with O, N or S nucleophiles, such as e.g. alcohols, primary or secondary amines, imines or mercaptans, into the correspondingly functionalised derivatives.

20 Aromatic chloroalkyl or, preferably, bromoalkyl groups may be obtained by radical chlorination or bromination of corresponding alkylaromatic groups. For example alkylaromatic groups may be converted by reaction with N-bromosuccinimide and a suitable radical starter, such as e.g. dibenzylperoxide, in a suitable solvent, such as e.g. carbon tetrachloride, into the corresponding bromoalkylaromatic groups.

25

Hydroxyl, primary or secondary amino, or thiol groups may also be converted by (hetero)arylation into optionally substituted (hetero)aryloxy, (hetero)arylamino, or (hetero)arylsulphonyl groups. This transformation is carried out by reaction with a suitable (hetero)aryllating agent, such as e.g. a (hetero)aryl halide (preferably chloride, bromide or

30

iodide), (hetero)arylmethylate, (hetero)aryltosylate or (hetero)aryltriflate in the presence of a suitable base and optionally a suitable (preferably Cu- or Pd-containing) catalyst (e.g. by an Ullmann or Buchwald-Hartwig reaction) or, as in a Chan-Lam reaction, a (hetero)arylboronic acid in the presence of a Cu-containing catalyst, in a suitable solvent.

35

Accordingly, in analogous or similar fashion, (hetero)aromatic halogen atoms (preferably chlorine, bromine or iodine) or (hetero)aromatic sulphonyloxy groups, such as e.g. methylsulphonyloxy, tosylsulphonyloxy or trifluoromethylsulphonyloxy, may be converted by a reaction of nucleophilic substitution with O, N or S nucleophiles, such as e.g. alcohols,

primary or secondary amines, imines or mercaptans, into the correspondingly functionalised derivatives.

(Hetero)aromatic sulphonyl, sulphinyl or sulphonyl groups may also be converted by a reaction of nucleophilic substitution of these groups with O, N or S nucleophiles, such as e.g. alcohols, primary or secondary amines, imines or mercaptans, in the presence of a suitable base, into the correspondingly O-, N- or S-functionalised derivatives.

Hydroxyl or primary or secondary amino groups may be converted by acylation or sulphonylation into corresponding carbonyloxy or sulphonyloxy or carbonylamino or sulphonylamino groups. The transformations are carried out by reacting corresponding hydroxyl or amino compounds with suitable acylating agents, such as for example carboxylic acid anhydrides, carboxylic acid halides (particularly carboxyl chlorides), activated carboxylic acid esters, carboxylic acid imidazolides or free carboxylic acids in the presence of suitable activating reagents (e.g. suitable coupling reagents such as e.g. diimides such as e.g. DCC, EDC, etc. or uronium reagents such as e.g. TOTU, HBTU, HATU, etc. or phosphonium reagents such as e.g. PyBOP, etc.) or with suitable sulphonylating agents, such as for example sulphonic acid anhydrides, sulphonic acid chlorides or sulphonylimides, in suitable solvents, such as e.g. dichloromethane, diethyl ether, 1,4-dioxane, tetrahydrofuran, toluene or acetonitrile, at temperatures between -78°C and 40°C, in the presence of a suitable base, such as e.g. triethylamine, N,N-diisopropyl-N-ethylamine, pyridine or 2,6-lutidine, optionally in the presence of an acylation catalyst, such as e.g. 4-dimethylaminopyridine.

Accordingly, in analogous or similar fashion, free carboxyl or sulpho groups may be converted into the corresponding functionalised derivatives by activation (e.g. by conversion into chlorocarbonyl or chlorosulphonyl groups or by the use of suitable activation reagents) and by reaction with O or N nucleophiles, such as e.g. alcohols, primary or secondary amines or imines.

Also, (hetero)aromatic hydroxyl groups may be converted into (hetero)aromatic sulphonyloxy groups, such as e.g. methylsulphonyloxy, tosylsulphonyloxy or trifluoromethylsulphonyloxy.

These (hetero)aromatic sulphonyloxy groups may be converted by CC-linking reaction (e.g. by Suzuki, Negishi or Heck reaction) into optionally substituted (cyclo)alkyl, (cyclo)alkenyl, (hetero)aryl or heterocyclyl groups. For this, the compounds are reacted with (hetero)aromatic sulphonyloxy groups, in the case of the Suzuki reaction, with corresponding potassium (cyclo)alkenyl, (hetero)aryl or heterocyclyl trifluoroborates, (cyclo)alkenyl-, (hetero)aryl- or heterocyclyl-boric acids or (cyclo)alkenyl-, (hetero)aryl- or heterocyclyl-boric acid pinacol esters or, in the case of the Heck reaction, with corresponding olefins, in a suitable solvent, such as e.g. toluene, DMF, isopropanol, acetonitrile, 1,4-dioxane or THF or

mixtures, in the presence of a suitable base, such as e.g. aqueous sodium carbonate, caesium fluoride, triethylamine, Hünig base, etc., and in the presence of a suitable (preferably palladium-containing) catalyst, such as e.g. tetrakis(triphenylphosphine) palladium, etc. or a suitable palladium source, such as e.g. Pd(OAc)₂, in the presence of a suitable
5 ligand, such as e.g. triphenylphosphine, tri-*o*-tolylphosphine, etc., at a suitable reaction temperature, such as e.g. in the range from 0°C to 180°C, preferably from ambient temperature to 120°C.

An optionally substituted C=C double bond may be converted into the corresponding single
10 bond by hydrogenation (e.g. catalytic hydrogenation with hydrogen). Optionally substituted cyclo(alkenyl) or unsaturated heterocyclyl groups, which may be obtained as hereinbefore described, may be converted into the corresponding (cyclo)alkyl or saturated heterocyclyl groups by hydrogenation, e.g. with hydrogen and in the presence of a suitable catalyst (such as e.g. Pd) in a suitable solvent (such as e.g. methanol, etc.), optionally under elevated
15 pressure.

An optionally substituted C=C double bond may also be converted into the corresponding cyclopropyl group by cyclopropanation, e.g. by Simmons-Smith reaction in the presence of bromo-iodo-methane or diiodomethane and diethylzinc, optionally in the presence of
20 trifluoroacetic acid.

Alkoxy carbonyl groups may be converted into hydroxymethyl groups by reduction with a suitable reducing agent (such as e.g. lithium aluminium hydride).

Cyano groups may be converted into aminomethyl groups by reduction with a suitable
25 reducing agent (such as e.g. Raney nickel).

Ketones or aldehydes may be converted into the corresponding aminated compounds by reductive amination with primary or secondary amines or ammonia by Schiff's base formation and reduction using a suitable reducing agent.
30

In the reactions described hereinbefore, any reactive groups present such as carboxy, hydroxy, amino or alkylamino groups may be protected during the reaction by conventional protecting groups which are cleaved again after the reaction.

35 For example, a protecting group for a carboxy group may be a methyl, ethyl, tert. butyl or benzyl group.

For example, a protecting group for a hydroxy group may be an acetyl, benzyl or tetrahydropyranyl group.

For example, a protecting group for an amino or alkylamino group may be for example a
5 formyl, acetyl, trifluoroacetyl, ethoxycarbonyl, tert.-butoxycarbonyl, benzyloxycarbonyl, benzyl, methoxybenzyl or 2,4-dimethoxybenzyl group.

A carboxymethyl or carboxyethyl unit may be cleaved hydrolytically, for example, in an aqueous solvent, e.g. in water, methanol/water, isopropanol/water, acetic acid/water,
10 tetrahydrofuran/water or dioxane/water, but preferably in methanol/water, in the presence of an acid such as trifluoroacetic acid, hydrochloric acid or sulphuric acid or in the presence of an alkali metal base such as lithium hydroxide, sodium hydroxide or potassium hydroxide, but preferably sodium hydroxide, or aprotically, e.g. in the presence of iodotrimethylsilane, at temperatures between 0 and 120°C, preferably at temperatures between 10 and 100°C.

15

A benzyl, methoxybenzyl or benzyloxycarbonyl group is advantageously cleaved hydrogenolytically, e.g. with hydrogen in the presence of a catalyst such as palladium on charcoal in a suitable solvent such as methanol, ethanol, ethyl acetate or glacial acetic acid, optionally with the addition of an acid such as hydrochloric acid at temperatures between 0
20 and 100°C, but preferably at temperatures between 20 and 60°C, and under a hydrogen pressure of 1 to 7 bar, preferably 1 to 3 bar. The 4-methoxybenzyl group may also be cleaved hydrolytically in the presence of an acid (such as e.g. trifluoroacetic acid), or oxidatively in the presence of an oxidising agent such as e.g. 2,3-dichloro-5,6-dicyanobenzoquinone (DDQ). Preferably the 4-methoxybenzyl group is cleaved in
25 trifluoroacetic acid in the presence of Veratrol. The cleaving of a 2,4-dimethoxybenzyl group is preferably carried out in trifluoroacetic acid in the presence of anisole.

A tert.-butyl or tert.-butyloxycarbonyl group is preferably cleaved by treating with an acid such as trifluoroacetic acid or hydrochloric acid or by treating with iodotrimethylsilane,
30 optionally using a solvent such as methylene chloride, dioxane, methanol or diethyl ether.

Moreover the compounds of general formula I obtained, or intermediate products from the synthesis of compounds of general formula I, as already mentioned hereinbefore, may be resolved into their enantiomers and/or diastereomers. Thus, for example, cis/trans mixtures
35 may be resolved into their cis and trans isomers, and compounds with at least one stereocentre may be resolved into their enantiomers.

Thus, for example, the cis/trans mixtures obtained may be resolved by chromatography into their cis and trans isomers, the compounds of general formula I obtained, or intermediate products from the synthesis of compounds of general formula I, which occur as racemates may be separated by methods known *per se* (cf. N. L. Allinger and E. L. Eliel in "Topics in Stereochemistry", Vol. 6, Wiley Interscience, 1971) into their optical antipodes, and
5 compounds of general formula I, or intermediate products from the synthesis of compounds of general formula I, with at least 2 asymmetric carbon atoms may be resolved into their diastereomers on the basis of their physical-chemical differences using methods known *per se*, e.g. by chromatography and/or fractional crystallisation, and, if these compounds are
10 obtained in racemic form, they may subsequently be resolved into the enantiomers as mentioned above.

The enantiomers are preferably separated by chromatography on chiral phases or by recrystallisation from an optically active solvent or by reacting with an optically active
15 substance which forms salts or derivatives such as e.g. esters or amides with the racemic compound, particularly acids and the activated derivatives, amines or alcohols thereof, and separating the diastereomeric mixture of salts or derivatives thus obtained, e.g. on the basis of their differences in solubility, whilst the free antipodes may be released from the pure diastereomeric salts or derivatives by the action of suitable agents. Optically active acids in
20 common use are e.g. the D- and L-forms of tartaric acid or dibenzoyltartaric acid, di-O-p-toluoyltartaric acid, malic acid, mandelic acid, camphorsulphonic acid, glutamic acid, aspartic acid or quinic acid. An optically active alcohol may be for example (+)- or (-)-menthol and an optically active acyl group in amides, for example, may be a (+)- or (-)-menthyloxycarbonyl.

25 Furthermore, the compounds of general formula I obtained, or intermediate products from the synthesis of compounds of general formula I, may be converted into the salts thereof, for pharmaceutical use in particular into the physiologically acceptable salts thereof with inorganic or organic acids. Acids which may be used for this purpose include for example
30 hydrochloric acid, hydrobromic acid, sulphuric acid, methanesulphonic acid, phosphoric acid, fumaric acid, succinic acid, lactic acid, citric acid, tartaric acid or maleic acid.

Moreover, the compounds of general formula I obtained, or intermediate products from the synthesis of compounds of general formula I, if they contain one or more acid groups (e.g. a
35 carboxyl group), may, if desired, be converted into the salts thereof with inorganic or organic bases, for pharmaceutical use particularly into the physiologically acceptable salts thereof.

Suitable bases for this purpose include for example sodium hydroxide, potassium hydroxide, arginine, cyclohexylamine, ethanolamine, diethanolamine and triethanolamine.

The corresponding salts may be obtained by conventional methods that are known in principle to those skilled in the art, for example by reaction with an organic or inorganic acid or base in a suitable solvent or dispersant, or by anion or cation exchange with other salts.

The following Examples are mentioned in order to render the invention comprehensible. The Examples are intended to assist with illustrating the invention and should not restrict it in any way.

The following Examples are intended to describe the invention more fully without restricting its scope.

Melting points and/or IR, UV, ¹H-NMR and/or mass spectra are generally available for the compounds obtained. Unless stated otherwise, R_f values were determined using ready-made silica gel 60 F₂₅₄ TLC plates (E. Merck, Darmstadt, Article No. 1.05714) without chamber saturation. The R_f values obtained under the heading Alox were determined using ready-made aluminium oxide 60 F₂₅₄ TLC plates (E. Merck, Darmstadt, Article no. 1.05713) without chamber saturation. The ratios specified for the eluants refer to units by volume of the respective solvent. For chromatographic purification, silica gel made by the company Merck KGaA (silica gel 60TM, 40-63 μm) was used. If no more detailed information is given as to configuration, it remains unclear whether the substance is a pure stereoisomer or a mixture of enantiomers/diastereomers.
