

US009958107B1

(12) United States Patent

Hobbs et al.

(54) EXPANDABLE SOCKETS FOR USE WITH PORTABLE MEDIA PLAYERS

- (71) Applicant: **POPSOCKETS LLC**, Boulder, CO (US)
- (72) Inventors: Molly M. Hobbs, Boulder, CO (US); David B. Barnett, Boulder, CO (US)
- (73) Assignee: **POPSOCKETS LLC**, Boulder, CO (US)
- (*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 0 days. days.
- (21) Appl. No.: 15/803,410
- (22) Filed: Nov. 3, 2017

Related U.S. Application Data

- (63) Continuation of application No. 15/679,934, filed on Aug. 17, 2017, which is a continuation of application No. 15/615,900, filed on Jun. 7, 2017.
- (60) Provisional application No. 62/376,237, filed on Aug. 17, 2016.

(57) **ABSTRACT**

An expandable socket for attachment to a portable media player or a portable media player case. The expandable socket generally includes a platform, a skin coupled to the platform, a button coupled to the skin opposite the platform, and a biasing element. The skin includes an outer wall, an inner wall spaced radially inward of the outer wall, and a cavity defined by the inner wall, wherein the skin is deformable between a collapsed configuration and an expanded configuration. The biasing element is arranged within the cavity of the skin between the platform and the button, such that the biasing element is at least partially surrounded by the inner wall of the skin. The biasing element is configured to bias the skin into the expanded configuration.

EXPANDABLE SOCKETS FOR USE WITH PORTABLE MEDIA PLAYERS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. application Ser. No. 15/679,934, filed Aug. 17, 2017, which claims priority under 35 U.S.C. § 119(e) to U.S. Provisional Application No. 62/376,237, filed Aug. 17, 2016, and is a continuation of ¹⁰ U.S. application Ser. No. 15/615,900 filed Jun. 7, 2017, which claims priority under 35 U.S.C. § 119(e) to U.S. Provisional Application No. 62/376,237, filed Aug. 17, 2016. The entire respective disclosures of each of the above-identified applications are incorporated herein by ¹⁵ reference.

FIELD OF THE INVENTION

The present invention relates generally to expandable ²⁰ sockets and more particularly to expandable sockets, which may also be referred to as collapsible sockets, that can be attached to portable media players (e.g., smart phones, MP3 players) or portable media player cases and used as grips, stands, or for other purposes. ²⁵

BACKGROUND

U.S. Pat. No. 8,560,031, which issued Oct. 15, 2013, and is hereby incorporated herein by reference, discloses extend-³⁰ ing sockets, formed of accordions generally with buttons attached at their distal ends, for attaching to portable media players or portable media player cases. The sockets are used to wrap cords, as grips or stands, and to attach the player to another object.³⁵

However, a need remains in the art for other designs of collapsible grips and stands.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1A is a side isometric, cutaway view of a first example of an expandable socket constructed in accordance with the teachings of the present invention, showing the socket in an expanded configuration;

FIG. **1B** is a side, cross-sectional view of FIG. **1**A, ⁴⁵ showing the socket in a collapsed configuration;

FIG. 1C is a top, cutaway view of a second example of an expandable socket constructed in accordance with the teachings of the present invention, showing the socket in a collapsed configuration;

FIG. **2** is a side, cross-sectional view of a third example of an expandable socket constructed in accordance with the teachings of the present invention, showing the socket in an expanded configuration;

FIG. **3**A is a side, cross-sectional view of a fourth example 55 of an expandable socket constructed in accordance with the teachings of the present invention, showing the socket in a collapsed configuration;

FIG. **3**B is similar to FIG. **3**A, but shows the socket in an expanded configuration; and

FIG. **3**C is a side-by-side, perspective view of the socket of FIG. **3**A and the socket of FIG. **3**B.

SUMMARY

One aspect of the present invention provides an expandable socket for attachment to a portable media player or a 2

portable media player case. The expandable socket includes a base adapted to engage a portion of the portable media player or the portable media player case, a cover coupled to the base, wherein the cover is movable between a collapsed position and an expanded position, a button coupled to the cover opposite the base, and a spring arranged within the cover between the base and the button.

Another aspect of the present invention provides an expandable socket for attachment to a portable media player or a portable media player case. The expandable socket includes a base adapted to engage a portion of the portable media player or the portable media player case, a button that is spaced from and movable relative to the base, and a spring disposed between the base and the button, the spring arranged to resist movement of the button toward the base.

Another aspect of the present invention provides an expandable socket for attachment to a portable media player or a portable media player case. The expandable socket includes a base adapted to engage a portion of the portable media player or the portable media player case, an elastomeric skin coupled to the base and having a hollow shape, the skin including at least one folded section and being deformable between a collapsed position and an expanded position, a button coupled to the skin opposite the base, the button being disposed a first distance from the base when the skin occupies the collapsed position and a second distance greater than the first distance from the base when the skin occupies the expanded position, and a spring arranged within the skin between the base and the button, the spring configured to resist movement of the skin from the expanded configuration.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

FIGS. 1A and 1B illustrate a first example of one example of an expandable socket 100 constructed in accordance with the teachings of the present invention. The expandable socket 100 in this example includes a button 104, a base 106, e.g., a platform, and a collapsible or expandable mechanism 102 coupled to and extending between the button 104 and the base 106. While removed from FIGS. 1A and 1B for clarity, the expandable socket 100 also includes a deformable cover (e.g., a cover as illustrated in FIG. 2) that is coupled to the button 104 and/or the base 106 in a manner that surrounds and houses (e.g., protects) the collapsible mechanism for safety and comfort. In other examples, the expandable socket 100 can include additional, different, and/or fewer components. As an example, the expandable socket 100 need not include the cover.

As best illustrated in FIG. 1A, the base 106 in this example has an annular shape. In other examples, however, the base 106 may instead have a rectangular, square, triangular, or other shape. The base 106 is preferably made of metal or plastic, though other suitable materials (e.g., cardboard) can be used. In any case, the base 106 is generally configured to be directly or indirectly coupled (e.g., attached, mounted) to a portable media player (e.g., an MP3 player, a smart phone, a tablet) or a case of such a portable media player. To this end, the base 106 can, in some cases, include a securing element known to one of ordinary skill in the art, such as, for example, adhesive, glue, tape, a suction cup, a snap-fit connection, a friction fit, other means, or combinations thereof. Alternatively, in other cases, the base 106 can be integrally formed with the portable media player or the case for the portable media player.

As best illustrated in FIG. 1A, the button 104 in this example has an annular shape. In other examples, however, the button 104 may have a rectangular, square, triangular, irregular, or other shape. The button 104 in this example also has an outer diameter that is larger than an outer diameter of 5 the base 106, though this need not be the case. Like the base 106, the button 104 is preferably made of metal or plastic, though other suitable materials can be used. The button 104 has an outer side 110 that may, for example, include a design (including, e.g., a logo, text, graphics, a picture). In some 10 cases, the design may be selected by a user of the expandable socket 100.

The collapsible or expandable mechanism 102 is generally configured to facilitate movement of the expandable socket 100 between an expanded configuration, illustrated in 15 FIG. 1A, and a collapsed configuration, illustrated in FIG. 1B, and to retain the expandable socket 100 in the desired configuration (expanded or collapsed). In this example, the mechanism 102 takes the form of two, thin strip springs 112 arranged within the cover (not shown), with each spring 112 20 having a first end 114 coupled (e.g., mounted) to an inner side 116, i.e., an underside, of the button 104, and a second end 118 coupled (e.g., mounted) to an inner side 120 of the platform 106. The first end 114 of the each strip 112 is preferably coupled to the inner side 116 of the button 104 at 25 or proximate to a perimeter edge 122 of the button 104, and the second end 118 of each strip 112 is preferably coupled to the inner side 116 of the platform 106 at or proximate to a center 123 of the platform 106. The first end 114 of each spring 112 may be removably coupled to the button 104, 30 fixedly coupled to the button **104**, or integrally formed with the button 104. Likewise, the second end 118 of each spring 112 may be removably coupled to the platform 106, fixedly coupled to the platform 106, or integrally formed with the platform 106.

In one example, the strips 112 are fabricated from spring steel or comparable metal. In another example, the strips 112 are produced from a stiff, flexible polymer. In any case, the strips 112 are preferably formed such that they are bistable, i.e., they each have two stable states in which they resist 40 movement (at least initially), with one of the stable states being the expanded state shown in FIG. 1A, which corresponds to the expanded configuration of the expandable socket 100, and the other of the stable states being the collapsed state shown in FIG. 1B, which corresponds to the 45 collapsed configuration of the expandable socket 100. Thus, when the strips **112** are in the expanded state shown in FIG. 1A, the strips 112 maintain (e.g., bias) the expandable socket 100 in the expanded configuration, and when the strips 112 are in the collapsed state shown in FIG. 1B, the strips 112 50 maintain (e.g., bias) the expandable socket 100 in the collapsed configuration.

In operation, the expandable socket **100** may be transitioned between the two configurations by manipulating the mechanism **102** between the two stable states. The mecha-55 nism **102** may be manipulated by grabbing or grasping the button **104** and rotating the button **104** about a longitudinal axis **124**, which will in turn rotate the mechanism **102** coupled thereto about the same longitudinal axis **124**, and/or grabbing or grasping the cover (not shown), which carries 60 the mechanism **102**, and rotating the cover about the longitudinal axis **124**. The strips **112** will, in turn, rotate about the longitudinal axis **124**, with the exact direction of rotation dependent upon whether the expandable socket **100** is being moved to the expanded configuration of FIG. **1A** or the 65 collapsed configuration of FIG. **1B**. When, for example, the expandable socket **100** is moved from the expanded con4

figuration of FIG. 1A to the collapsed configuration of FIG. 1B, the button 104 and the strips 112 will rotate in a first rotational direction (e.g., a counter-clockwise direction) about the longitudinal axis 124, thereby moving the button 104, the strips 112, and the cover toward the platform 106 along the longitudinal axis 124 in a first axial direction, and substantially reducing the profile of the expandable socket 100. Conversely, when the expandable socket 100 is moved from the collapsed configuration of FIG. 1B to the expanded configuration of FIG. 1A, the button 104, the strips 112, and the cover will rotate in a second direction, opposite the first direction, about the longitudinal axis 124, thereby moving the button 104, the strips 112, and the cover away from the platform 106 along the longitudinal axis 124 in a second axial direction opposite the first axial direction. Thus, the button 104 is spaced from the platform 106 so as to permit the user of the expandable socket 100 to wrap a headphone cord of the portable media player around a portion of the expandable socket 100, forming an adjustable stand for the portable media player, forming a grip for the portable media player, and/or to perform other desired functionality.

FIG. 1C illustrates a second example an expandable socket **150** constructed in accordance with the teachings of the present invention. The expandable socket **150** is substantially similar to the expandable socket **100**, in that it also includes the button **104**, the platform **106**, and the mechanism **102**. However, in the expandable socket **150**, the strips **112** are wrapped in the opposite direction from their path in the expandable socket **100**. Thus, the expandable socket **150** may generally be transitioned between a collapsed configuration, shown in FIG. **1**C, and an expanded configuration, not shown, by rotating the button **104** and/or the cover in a direction opposite how the button **104** and/or the cover are rotated in the expandable socket **100**.

FIG. 2 illustrates a third example of an expandable socket 200 constructed in accordance with the teachings of the present invention. The expandable socket 200 generally includes a button 204, a base 206, a collapsible or expandable mechanism 202 coupled to and extending between the button 204 and the base 206, a deformable cover 212 that is coupled to the button 204 and/or the base 206 in a manner that surrounds and houses the collapsible mechanism 202 for safety and comfort, and a lock 214 configured to releasably secure the expandable socket 200 in a collapsed configuration that is not shown but is consistent with the collapsed configuration of the expandable socket 100 described above. In other examples, the expandable socket 200 may include additional, fewer, or different components. As an example, the expandable socket 200 may not include the cover 212.

The cover **212** is generally coupled to and disposed between the button **204** and the base **206**. The cover **212** preferably takes the form of an elastomeric skin (made of an elastomeric material) that includes a plurality of folding sections **214** connected to one another between the button **204** and the base **206**. In some examples, such as illustrated in FIG. **2**, the plurality of folding sections **214** are arranged so as to form or a define a tapered conical shape that looks like an accordion. Thus, in these examples, the cover **212** has an outer diameter that tapers from the button **204** to the base **206** (though the opposite is possible as well). In other examples, the plurality of folding sections **214** may be arranged to form a different shape or the cover **212** may only include one folding section **214**.

Like the collapsible mechanism 102, the collapsible mechanism 202 generally facilitates movement of the expandable socket 200 between an expanded configuration, illustrated in FIG. 2, and the collapsed configuration, not

shown, and to retain the expandable socket 200 in the desired configuration (expanded or collapsed). However, the collapsible mechanism 202 in this example takes the form of a coil spring 218 (e.g., made of, for example, metal or plastic) that is arranged within the cover 212 between the 5 button 204 and the base 206, such that the cover 212 surrounds and houses (e.g., protects) the coil spring 218. More particularly, the coil spring 218 has a first end 220 that is seated against the inner side 116 of the button 204 and a second end 222, opposite the first end 220, that is seated 10 against the inner side 120 of the base 206. The coil spring 218 illustrated in FIG. 2 has a shape that substantially corresponds to the shape of the cover 212. In other words, the coil spring 218 illustrated in FIG. 2 has a conical or tapered shape, such that the first end 220 has an outer 15 diameter that is larger than an outer diameter of the second end 222.

The button 204 in this example is similar to the button 104 described above, with common components referred to using common reference numerals. However, unlike the 20 button 104, the button 204 also includes a first projection 210 that is carried by the and extends axially inward of and from the inner side 116 of the button 204. The base 206 in this example is likewise similar to the base 206 described above, with common components referred to using common 25 reference numerals. However, unlike the base 106, the base 206 also includes a pair of second projections 208 that are carried by the inner side 120 of the base 206. The projections 208 extend axially inward from the inner side 120 of the base 206 before extending radially inward, thereby defining 30 a recess 216 sized to receive the first projection 210.

As will be appreciated from FIG. 2, the coil spring 218 is arranged to bias the expandable socket 200 to its expanded configuration. More particularly, the coil spring 218 is arranged to bias the button 204 and the cover 212 away from the base 206 and to the positions shown in FIG. 2, which correspond to the expanded configuration of the expandable socket 200. Thus, the coil spring 218 may also be referred to herein as the biasing element 218. In any case, when the expandable socket 200 is in the expanded configuration, the button 204 is spaced from the platform 206 so as to permit the user of the expandable socket 200 to wrap a headphone cord of the portable media player around a portion of the expandable socket 200, forming an adjustable stand for the portable media player, forming a grip for the portable media player, form other desired functionality.

The expandable socket 200 may be moved from this expanded configuration to the collapsed configuration by overcoming the biasing force applied by the coil spring 218. Generally speaking, the user of the expandable socket 200 50 may accomplish this by grabbing or grasping the button 204 and/or the cover 212 and moving (e.g., pushing) the button 204 and the cover 212 toward the platform 206 along a longitudinal axis 224. As the button 204 and the cover 212 are moved toward the platform 206 in this manner, the 55 plurality of folding sections 214 fold onto one another and the button 204, the cover 212, and the coil spring 218 may rotate about the longitudinal axis 224.

As will also be appreciated from FIG. 2, the recess 216 is arranged to receive and retain the first projection 210 when ⁶⁰ the expandable socket 200 is moved to the collapsed configuration such that the button 204 is moved toward and into close proximity with the base 206. As this happens, the first projection 210 is moved past the second projections 208 and into the recess 216, at which time the second projections 208 ⁶⁵ engage the first projection 210 (and vice-versa). By virtue of the shape and size of the first projection 210 and the second

projections 208, the first projection 210 is securely retained in the recess 216. In this manner, the first projection 210, the second projections 208, and the recess 216 define or form the lock 214 that locks the expandable socket 200 in the collapsed configuration.

One of ordinary skill in the art will appreciate that the first projection **210** and the second projections **208** can be reversed and yet still interact to help lock the Popsocket **200** in the collapsed configuration. More particularly, the first projection **210** can be carried by the base **206** and the second projections **208** (which define the recess **216**) can be carried by the button **204**.

The user of the expandable socket 200 may move the expandable socket 200 from the collapsed configuration to the expanded configuration by releasing the lock 214. Generally speaking, the user may release the lock 214 by grabbing or grasping and rotating the button 204 and/or the cover 212 about the longitudinal axis 224, which therefore rotates first projection 210 out of engagement with the second projections 208 and out of the recess 216. Once the lock 214 has been released, the biasing force of the coil spring 218 drives the button 204 and the cover 212 outward, away from the base 206, until the button 204 and the cover 212 reach the expanded configuration.

FIGS. **3**A-**3**C illustrate a fourth example of an expandable socket **300** constructed in accordance with the teachings of the present invention. The expandable socket **300** is similar to the expandable socket **200** in that it includes a button **304**, a base **306**, a collapsible or expandable mechanism **302** coupled to and extending between the button **304** and the base **306**, and a lock configured to releasably secure the expandable socket **300** in an expanded configuration (shown in FIG. **3B**), but is different from the expandable socket **200** in the manner described below. In other examples, the expandable socket **300** may include additional, fewer, or different components. As an example, the expandable socket **300** may also include a deformable cover such as the cover **212**.

As with the collapsible mechanism 102 and the collapsally facilitates movement of the expandable socket 300 between a collapsed configuration, shown in FIG. 3A, and the expanded configuration shown in FIG. 3B. However, the collapsible mechanism 302 in this example takes the form of a plurality of concentric rings 322 arranged between the button 304 and the base 306. In this example, the collapsible mechanism 302 includes three concentric rings 322A, 322B, and 322C each having a substantially wedge-shaped crosssection, though in other examples, more or less concentric rings may be employed and/or the concentric rings may have a different shape. In any case, the concentric rings 322 are movable relative one another along a longitudinal axis 324 as the expandable socket 300 moves between the collapsed and expanded configurations. Moreover, as illustrated in FIGS. 3A and 3B, the concentric ring 322B is movable within the concentric ring 322A and the concentric ring 322C is movable within the concentric ring 322B (and, in turn, the ring 322A) as the expandable socket 300 moves between the collapsed and expanded configurations.

The button 304 in this example is similar to the button 104 described above, with common components referred to using common reference numerals. However, unlike the button 104, the button 304 also includes a first, annular projection 308 that is carried by and extends axially inward of and from the inner side 116 of the button 304 at or proximate to a perimeter edge 320 of the button 304. The projection 308 in this example has an inner surface 314 that

curves radially inward as the projection 308 extends away from the button 304. The inner surface 314 is therefore arranged to interface with an outermost one of the concentric rings 322 (the concentric ring 322A in this example) to help maintain the concentric rings 322 in the proper position 5 between the button 304 and the base 306.

The base 306 in this example is similar to the base 106 described above, with common components referred to using common reference numerals. However, unlike the 10 base 106, the base 306 includes a second, annular projection 310 that is carried by and extends axially inward of and from the inner side 120 of the base 106. The second projection 310 is disposed radially inward of both the first projection 308 and the concentric rings 322. In other words, the second $_{15}$ projection 310 is nested within the first projection 308 and the concentric rings 322. The second projection 310 has an outer surface 312 that tapers as the projection 310 extends away from the base 306. A detent 313 is formed at or proximate to an end of the outer surface 312. The detent 313 20 is thus arranged to interface with an innermost one of the concentric rings 322 (the concentric ring 322C in this example) to help maintain the concentric rings 322 in the proper position between the button 304 and the base 306. In some examples, such as the one illustrated in FIGS. 3A and 253B, the innermost concentric ring 322 (322C in this example) may also include a groove that is sized to receive and interferingly engage the detent 313 in order to further help maintain the concentric rings 322 in the proper position.

In operation, the expandable socket 300 may be transitioned between the expanded and collapsed configurations by manipulating the button 304 and/or the mechanism 302. More particularly, the user of the expandable socket 300 may move the expandable socket 300 from the collapsed 35 configuration (FIG. 3A) to the expanded configuration (FIG. 3B) by, for example, grabbing or grasping the button 304 and moving (e.g., pulling) the button 304 upward, away from the base 306, along the longitudinal axis 324. As briefly mentioned above, the expandable socket 300 includes a lock 40 comprises an elastomeric material. that may in turn lock, or securely retain, the expandable socket 300 in this expanded configuration. In this example, the lock is a friction-based lock that is defined by the detent 313 and the inner surface 315, which not only help to maintain the concentric rings 322 in the proper position 45 between the button 304 and the base 306, but also respectively frictionally engage the innermost and outermost of the concentric rings 322 (322C and 322A, respectively, in this example) when the expandable socket 300 is in the 50 expanded configuration In this example, the concentric rings **322** are also shaped so as to frictionally engage one or both adjacent concentric rings 322 when the expandable socket 300 is in the expanded configuration, thereby helping to lock the expandable socket 300 in the expanded configuration. 55 The user of the expandable socket 300 may release or disengage these locking features, and move the expandable socket 300 from the expanded configuration to the collapsed configuration, by, for example, moving (e.g., pushing, pressing) the button 304 downward, toward the base 306, along $_{60}$ the longitudinal axis 324. As the expandable socket 300 is moved from the expanded configuration to the collapsed configuration, the concentric rings 322 nest within one another, with the innermost ring 322 nesting within the next innermost ring 322 and so on, until the projection 310 is 65 positioned immediately adjacent or in contact with the inner side 116 of the button 304.

The invention claimed is:

1. An expandable socket for attachment to a portable media player or a portable media player case, the expandable socket comprising:

- a platform adapted to engage a portion of the portable media player or the portable media player case;
- a button that is spaced from and movable relative to the platform:
- a biasing element disposed between the platform and the button, the biasing element arranged to bias the button away from the platform; and
- a lock configured to releasably secure the button to the platform, the lock comprising a first projection carried by the button and arranged to engage a second projection carried by the platform when the lock releasably secures the button to the platform,

wherein the first projection extends outward from the button in a first direction and the second projection extends outward from the platform in a second direction opposite the first direction, and

wherein the lock comprises a recess defined by the platform or the button, the recess configured to receive the first or second projection when the lock releasably secures the button to the platform.

2. The expandable socket of claim 1, wherein the first projection has an outer diameter that is less than a diameter of the button.

3. The expandable socket of claim 1, wherein the second projection has an outer diameter that is less than a diameter of the platform.

4. The expandable socket of claim 1, wherein the first projection has an outer diameter that is less than a diameter of the button, and wherein the second projection has an outer diameter that is less than a diameter of the platform.

5. The expandable socket of claim 1, further comprising a skin arranged between the platform and the button, wherein the skin surrounds the biasing element.

6. The expandable socket of claim 5, wherein the skin

7. The expandable socket of claim 5, wherein the skin comprises at least one folding section.

8. The expandable socket of claim 1, wherein the biasing element comprises a conical coil spring.

9. An expandable socket for attachment to a portable media player or a portable media player case, the expandable socket comprising:

- a platform adapted to engage a portion of the portable media player or the portable media player case;
- a button that is spaced from and movable relative to the platform:
- a skin arranged between the platform and the button, wherein the skin comprises at least two folding sections:
- a biasing element disposed between the platform and the button, the biasing element arranged to bias the button away from the platform; and
- a first projection carried by the button and arranged to selectively engage a second projection carried by the platform to releasably secure the button to the platform, wherein the first projection extends outward from the button in a first direction and the second projection extends outward from the platform in a second direction opposite the first direction.

10. The expandable socket of claim 9, wherein the skin is movable between a collapsed configuration and an expanded configuration, and wherein the at least two folding sections

are configured to fold onto one another as the skin is moved from the expanded configuration to the expanded configuration.

11. The expandable socket of claim 9, wherein the skin has a first end coupled to the button and a second end 5 coupled to the platform, the skin having a first diameter at the first end and a second diameter at the second end, the second diameter being less than the first end.

12. The expandable socket of claim **9**, wherein the skin surrounds the biasing element.

13. The expandable socket of claim 9, wherein the skin ¹⁰ comprises an elastomeric material.

14. The expandable socket of claim **9**, wherein the biasing element comprises a conical coil spring.

15. The expandable socket of claim **9**, further comprising a recess defined by the platform or the button, the recess ¹⁵ configured to selectively receive the first or second projection to releasably secure the button to the platform.

16. An expandable socket for attachment to a portable media player or a portable media player case, the expandable socket comprising: 20

- a platform adapted to engage a portion of the portable media player or the portable media player case;
- an elastomeric skin coupled to the platform and having at least two folding sections defining an outer wall and an

10

inner wall spaced radially inward of the outer wall, the skin including a cavity defined by the inner wall and being deformable between a collapsed configuration and an expanded configuration;

- a button coupled to the skin opposite the platform, the button being disposed a first distance from the platform when the skin occupies the collapsed configuration and a second distance greater than the first distance from the platform when the skin occupies the expanded configuration;
- a spring arranged within the cavity of the skin between the platform and the button, such that the spring is surrounded by the inner wall of the skin, the spring biasing the button away from the platform to urge the skin into the expanded configuration; and
- a lock for selectively coupling the button to the platform such that the skin occupies the collapsed configuration when the button and platform are coupled, the lock comprising a first projection carried by the button and arranged to engage a second projection carried by the platform when the lock selectively couples the button to the platform.
